## Foundations of AFEM I

For a closed subspace  $V \subset H^1(\Omega)$  we assume

$$a(\cdot, \cdot) : V \times V \rightarrow \mathbb{R}$$

to be a **bounded,  $V$ -elliptic bilinear form**, i.e.,

$$|a(\mathbf{v}, \mathbf{w})| \leq C \|\mathbf{v}\|_{k,\Omega} \|\mathbf{w}\|_{k,\Omega}, \quad \mathbf{v}, \mathbf{w} \in V, \quad a(\mathbf{v}, \mathbf{v}) \geq \gamma \|\mathbf{v}\|_{k,\Omega}^2, \quad \mathbf{v} \in V,$$

for some constants  $C > 0$  and  $\gamma > 0$ . We further assume  $\ell \in V^*$  where  $V^*$  denotes the algebraic and topological dual of  $V$  and consider the **variational equation**:

Find  $\mathbf{u} \in V$  such that

$$a(\mathbf{u}, \mathbf{v}) = \ell(\mathbf{v}) \quad , \quad \mathbf{v} \in V.$$

It is well-known by the **Lax-Milgram Lemma** that under the above assumptions the variational problem admits a unique solution.

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Foundations of AFEM II

Finite element approximations are based on the **Ritz-Galerkin approach**: Given a finite dimensional subspace  $V_h \subset V$  of test/trial functions, find  $u_h \in V_h$  such that

$$a(u_h, v_h) = \ell(v_h), \quad v_h \in V_h.$$

Since  $V_h \subset V$ , the existence and uniqueness of a discrete solution  $u_h \in V_h$  follows readily from the Lax-Milgram Lemma. Moreover, we deduce that the error  $e_u := u - u_h$  satisfies the **Galerkin orthogonality**

$$a(u - u_h, v_h) = 0, \quad v_h \in V_h,$$

i.e., the approximate solution  $u_h \in V_h$  is the projection of the solution  $u \in V$  onto  $V_h$  with respect to the inner product  $a(\cdot, \cdot)$  on  $V$  (elliptic projection). Using the Galerkin orthogonality, it is easy to derive the **a priori error estimate**

$$\|u - u_h\|_{1,\Omega} \leq M \inf_{v_h \in V_h} \|u - v_h\|_{1,\Omega},$$

where  $M := C/\gamma$ . This result tells us that the error is of the same order as the best approximation of the solution  $u \in V$  by functions from the finite dimensional subspace  $V_h$ . It is known as **Céa's Lemma**.

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Foundations of AFEM III

The Ritz-Galerkin method also gives rise to an **a posteriori error estimate** in terms of the residual  $\mathbf{r} : \mathbf{V} \rightarrow \mathbb{R}$

$$\mathbf{r}(\mathbf{v}) := \ell(\mathbf{v}) - \mathbf{a}(\mathbf{u}_h, \mathbf{v}), \quad \mathbf{v} \in \mathbf{V}.$$

In fact, it follows that for any  $\mathbf{v} \in \mathbf{V}$

$$\gamma \|\mathbf{u} - \mathbf{u}_h\|_{1,\Omega}^2 \leq \mathbf{a}(\mathbf{u} - \mathbf{u}_h, \mathbf{u} - \mathbf{u}_h) = \mathbf{r}(\mathbf{u} - \mathbf{u}_h) \leq \|\mathbf{r}\|_{-1,\Omega} \|\mathbf{u} - \mathbf{u}_h\|_{1,\Omega},$$

whence

$$\|\mathbf{u} - \mathbf{u}_h\|_{1,\Omega} \leq \frac{1}{\gamma} \sup_{\mathbf{v} \in \mathbf{V}} \frac{|\mathbf{r}(\mathbf{v})|}{\|\mathbf{v}\|_{1,\Omega}}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Foundations of AFEM IV

**Definition.** An error estimator  $\eta_h$  is called **reliable**, if it provides an upper bound for the error up to data oscillations  $\text{osc}_h^{\text{rel}}$ , i.e., if there exists a constant  $C_{\text{rel}} > 0$ , independent of the mesh size  $h$  of the underlying triangulation, such that

$$\|e_u\|_a \leq C_{\text{rel}} \eta_h + \text{osc}_h^{\text{rel}}.$$

On the other hand, an estimator  $\eta_h$  is said to be **efficient**, if up to data oscillations  $\text{osc}_h^{\text{eff}}$  it gives rise to a lower bound for the error, i.e., if there exists a constant  $C_{\text{eff}} > 0$ , independent of the mesh size  $h$  of the underlying triangulation, such that

$$\eta_h \leq C_{\text{eff}} \|e_u\|_a + \text{osc}_h^{\text{eff}}.$$

Finally, an estimator  $\eta_h$  is called **asymptotically exact**, if it is both reliable and efficient with  $C_{\text{rel}} = C_{\text{eff}}^{-1}$ .

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Reliability and Efficiency of Error Estimators II

**Remark.** The notion 'reliability' is motivated by the use of the error estimator in error control. Given a tolerance  $\text{tol}$ , an idealized **termination criterion** would be

$$\|e_u\|_a \leq \text{tol}.$$

Since the error  $\|e_u\|_a$  is unknown, we replace it with the upper bound, i.e.,

$$C_{\text{rel}} \eta_h + \text{osc}_h^{\text{rel}} \leq \text{tol}.$$

We note that the termination criterion both requires the knowledge of  $C_{\text{rel}}$  and the incorporation of the data oscillation term  $\text{osc}_h^{\text{rel}}$ . In the special case  $C_{\text{rel}} = 1$  and  $\text{osc}_h^{\text{rel}} \equiv 0$ , it reduces to

$$\eta_h \leq \text{tol}.$$

An alternative, but less used termination criterion is based on the lower bound, i.e., we require

$$\frac{1}{C_{\text{eff}}} \left( \eta_h - \text{osc}_h^{\text{eff}} \right) \leq \text{tol}.$$

Typically, this criterion leads to less refinement and thus requires less computational time which motivates to call the estimator efficient.

## The Role of the Residual

The error estimate

$$\|\mathbf{u} - \mathbf{u}_h\|_{1,\Omega} \leq \frac{1}{\gamma} \sup_{\mathbf{v} \in \mathbf{V}} \frac{|\mathbf{r}(\mathbf{v})|}{\|\mathbf{v}\|_{1,\Omega}}$$

shows that in order to assess the error  $\|\mathbf{e}_u\|_a$  we are supposed to evaluate the norm of the residual with respect to the dual space  $\mathbf{V}^*$ , i.e.,

$$\|\mathbf{r}\|_{\mathbf{V}^*} := \sup_{\mathbf{v} \in \mathbf{V} \setminus \{0\}} \frac{|\mathbf{r}(\mathbf{v})|}{\|\mathbf{v}\|_a}.$$

In particular, we have the equality

$$\|\mathbf{r}\|_{\mathbf{V}^*} = \|\mathbf{e}_u\|_a,$$

whereas for the relative error of  $\mathbf{r}(\mathbf{v})$ ,  $\mathbf{v} \in \mathbf{V}$ , as an approximation of  $\|\mathbf{e}_u\|_a$  we obtain

$$\frac{(\|\mathbf{e}_u\|_a - \mathbf{r}(\mathbf{v}))}{\|\mathbf{e}_u\|_a} = \frac{1}{2} \left\| \mathbf{v} - \frac{\mathbf{e}_u}{\|\mathbf{e}_u\|_a} \right\|_a^2, \quad \mathbf{v} \in \mathbf{V} \text{ with } \|\mathbf{v}\|_a = 1.$$

The goal is to obtain lower and upper bounds for  $\|\mathbf{r}\|_{\mathbf{V}^*}$  at relatively low computational expense.

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

**Model problem:** Let  $\Omega$  be a bounded simply-connected polygonal domain in Euclidean space  $\mathbb{R}^2$  with boundary  $\Gamma = \Gamma_D \cup \Gamma_N$ ,  $\Gamma_D \cap \Gamma_N = \emptyset$  and consider the elliptic boundary value problem

$$\begin{aligned} Lu &:= -\nabla \cdot (\mathbf{a} \nabla u) = f \quad \text{in } \Omega, \\ u &= 0 \quad \text{on } \Gamma_D, \quad \mathbf{n} \cdot \mathbf{a} \nabla u = g \quad \text{on } \Gamma_N, \end{aligned}$$

where  $f \in L^2(\Omega)$ ,  $g \in L^2(\Gamma_N)$  and  $\mathbf{a} = (a_{ij})_{i,j=1}^2$  is supposed to be a matrix-valued function with entries  $a_{ij} \in L^\infty(\Omega)$ , that is symmetric and uniformly positive definite. The vector  $\mathbf{n}$  denotes the exterior unit normal vector on  $\Gamma_N$ . Setting

$$\mathbf{H}_{0,\Gamma_D}^1(\Omega) := \{ v \in \mathbf{H}^1(\Omega) \mid v|_{\Gamma_D} = 0 \},$$

the weak formulation is as follows: Find  $u \in \mathbf{H}_{0,\Gamma_D}^1(\Omega)$  such that

$$\mathbf{a}(u, v) = \ell(v) \quad , \quad v \in \mathbf{H}_{0,\Gamma_D}^1(\Omega),$$

where

$$\mathbf{a}(v, w) := \int_{\Omega} \mathbf{a} \nabla v \cdot \nabla w \, dx, \quad \ell(v) := \int_{\Omega} f v \, dx + \int_{\Gamma_N} g v \, d\sigma \quad , \quad v \in \mathbf{H}_{0,\Gamma_D}^1(\Omega).$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

**FE Approximation:** Given a geometrically conforming simplicial triangulation  $\mathcal{T}_h$  of  $\Omega$ , we denote by

$$S_{1,\Gamma_D}(\Omega; \mathcal{T}_h) := \{ v_h \in H_{0,\Gamma_D}^1(\Omega) \mid v_h|_T \in P_1(K), T \in \mathcal{T}_h \}$$

the trial space of continuous, piecewise linear finite elements with respect to  $\mathcal{T}_h$ . Note that  $P_k(T)$ ,  $k \geq 0$ , denotes the linear space of polynomials of degree  $\leq k$  on  $T$ . In the sequel we will refer to  $\mathcal{N}_h(\mathbf{D})$  and  $\mathcal{E}_h(\mathbf{D})$ ,  $\mathbf{D} \subseteq \bar{\Omega}$  as the sets of vertices and edges of  $\mathcal{T}_h$  on  $\mathbf{D}$ . We further denote by  $|T|$  the area, by  $h_T$  the diameter of an element  $T \in \mathcal{T}_h$ , and by  $h_E = |E|$  the length of an edge  $E \in \mathcal{E}_h(\Omega \cup \Gamma_N)$ . We refer to  $f_T := |T|^{-1} \int_T f dx$  the integral mean of  $f$  with respect to an element  $T \in \mathcal{T}_h$  and to  $g_E := |E|^{-1} \int_E g ds$  the mean of  $g$  with respect to the edge  $E \in \mathcal{E}_h(\Gamma_N)$ .

The conforming P1 approximation reads as follows: Find  $u_h \in S_{1,\Gamma_D}(\Omega; \mathcal{T}_h)$  such that

$$a(u_h, v_h) = \ell(v_h), \quad v_h \in S_{1,\Gamma_D}(\Omega; \mathcal{T}_h).$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Representation of the Residual I

The residual  $\mathbf{r}$  is given by

$$\mathbf{r}(\mathbf{v}) := \int_{\Omega} \mathbf{f} \cdot \mathbf{v} \, dx + \int_{\Gamma_N} \mathbf{g} \cdot \mathbf{v} \, ds - \mathbf{a}(\mathbf{u}_h, \mathbf{v}), \quad \mathbf{v} \in \mathbf{V}.$$

Applying Green's formula elementwise yields

$$\mathbf{a}(\mathbf{u}_h, \mathbf{v}) = \sum_{\mathbf{T} \in \mathcal{T}_h} \int_{\mathbf{T}} \mathbf{a} \cdot \nabla \mathbf{u}_h \cdot \nabla \mathbf{v} \, dx = \sum_{\mathbf{E} \in \mathcal{E}_h(\Omega)} \int_{\mathbf{E}} [\mathbf{n} \cdot \mathbf{a} \cdot \nabla \mathbf{u}_h] \cdot \mathbf{v} \, ds + \sum_{\mathbf{E} \in \mathcal{E}_h(\Gamma_N)} \int_{\mathbf{E}} \mathbf{n} \cdot \mathbf{a} \cdot \nabla \mathbf{u}_h \cdot \mathbf{v} \, ds,$$

where  $[\mathbf{n} \cdot \mathbf{a} \cdot \nabla \mathbf{u}_h]$  denotes the jump of the normal derivative of  $\mathbf{u}_h$  across  $\mathbf{E} \in \mathcal{E}_h(\Omega)$  and where we have used that  $\Delta \mathbf{u}_h \equiv \mathbf{0}$  on  $\mathbf{T} \in \mathcal{T}_h$ , since  $\mathbf{u}_h|_{\mathbf{T}} \in \mathbf{P}_1(\mathbf{T})$ . We thus obtain

$$\mathbf{r}(\mathbf{v}) := \sum_{\mathbf{T} \in \mathcal{T}_h} \mathbf{r}_{\mathbf{T}}(\mathbf{v}) + \sum_{\mathbf{E} \in \mathcal{E}_h(\Omega \cup \Gamma_N)} \mathbf{r}_{\mathbf{E}}(\mathbf{v}).$$

## Representation of the Residual II

Here, the local residuals  $\mathbf{r}_T(\mathbf{v})$ ,  $T \in \mathcal{T}_h$ , are given by

$$\mathbf{r}_T(\mathbf{v}) := \int_T (\mathbf{f} - \mathbf{L}u_h) \mathbf{v} \, dx,$$

whereas for  $\mathbf{r}_E(\mathbf{v})$  we have

$$\mathbf{r}_E(\mathbf{v}) := - \int_E [\mathbf{n} \cdot \mathbf{a} \, \nabla u_h] \mathbf{v} \, ds, \quad E \in \mathcal{E}_h(\Omega),$$

$$\mathbf{r}_E(\mathbf{v}) := \int_E \left( \mathbf{g} - \mathbf{n} \cdot \mathbf{a} \, \nabla u_h \right) \mathbf{v} \, ds, \quad E \in \mathcal{E}_h(\Gamma_N).$$

## A Posteriori Error Estimator and Data Oscillations

The error estimator  $\eta_h$  consists of element residuals  $\eta_T$ ,  $T \in \mathcal{T}_h$ , and edge residuals  $\eta_E$ ,  $E \in \mathcal{E}_H(\Omega \cup \Gamma_N)$ , according to

$$\eta_h := \left( \sum_{T \in \mathcal{T}_h} \eta_T^2 + \sum_{E \in \mathcal{E}_H(\Omega \cup \Gamma_N)} \eta_E^2 \right)^{1/2},$$

where  $\eta_T$  and  $\eta_E$  are given by

$$\eta_T := h_T \|\mathbf{f}_T - \mathbf{L}u_h\|_{0,T}, \quad T \in \mathcal{T}_h,$$
$$\eta_E := \begin{cases} h_E^{1/2} \|\mathbf{n} \cdot \mathbf{a} \nabla u_h\|_{0,E}, & E \in \mathcal{E}_h(\Omega), \\ h_E^{1/2} \|\mathbf{g}_E - \mathbf{n} \cdot \mathbf{a} \nabla u_h\|_{0,E}, & E \in \mathcal{E}_h(\Gamma_N). \end{cases}$$

The a posteriori error analysis further invokes the data oscillations

$$\text{osc}_h := \left( \sum_{T \in \mathcal{T}_h} \text{osc}_T^2(\mathbf{f}) + \sum_{E \in \mathcal{E}_h(\Gamma_N)} \text{osc}_E^2(\mathbf{g}) \right)^{1/2},$$

where  $\text{osc}_T(\mathbf{f})$  and  $\text{osc}_E(\mathbf{g})$  are given by

$$\text{osc}_T(\mathbf{f}) := h_T \|\mathbf{f} - \mathbf{f}_T\|_{0,T}, \quad \text{osc}_E(\mathbf{g}) := h_E^{1/2} \|\mathbf{g} - \mathbf{g}_E\|_{0,E}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Clément's Quasi-Interpolation Operator I

For  $\mathbf{p} \in \mathcal{N}_h(\Omega) \cup \mathcal{N}_h(\Gamma_N)$  we denote by  $\varphi_{\mathbf{p}}$  the basis function in  $S_{1,\Gamma_D}(\Omega; \mathcal{T}_h)$  with supporting point  $\mathbf{p}$ , and we refer to  $D_{\mathbf{p}}$  as the set

$$D_{\mathbf{p}} := \bigcup \{ \mathbf{T} \in \mathcal{T}_h \mid \mathbf{p} \in \mathcal{N}_h(\mathbf{T}) \}.$$

We refer to  $\pi_{\mathbf{p}}$  as the  $L^2$ -projection onto  $P_1(D_{\mathbf{p}})$ , i.e.,

$$(\pi_{\mathbf{p}}(\mathbf{v}), \mathbf{w})_{0,D_{\mathbf{p}}} = (\mathbf{v}, \mathbf{w})_{0,D_{\mathbf{p}}} \quad , \quad \mathbf{w} \in P_1(D_{\mathbf{p}}),$$

where  $(\cdot, \cdot)_{0,D_{\mathbf{p}}}$  stands for the  $L^2$ -inner product on  $L^2(D_{\mathbf{p}}) \times L^2(D_{\mathbf{p}})$ . Then, Clément's interpolation operator  $P_C$  is defined as follows

$$P_C : L^2(\Omega) \longrightarrow S_{1,\Gamma_D}(\Omega, \mathcal{T}_h), \quad P_C \mathbf{v} := \sum_{\mathbf{p} \in \mathcal{N}_h(\Omega) \cup \mathcal{N}_h(\Gamma_N)} \pi_{\mathbf{p}}(\mathbf{v}) \varphi_{\mathbf{p}}.$$

## Clément's Quasi-Interpolation Operator II

**Theorem.** Let  $\mathbf{v} \in \mathbf{H}_{0,\Gamma_D}^1(\Omega)$ . Then, for Clément's interpolation operator there holds

$$\begin{aligned} \|\mathbf{P}_C \mathbf{v}\|_{0,T} &\leq C \|\mathbf{v}\|_{0,D_T^{(1)}}, & \|\mathbf{P}_C \mathbf{v}\|_{0,E} &\leq C \|\mathbf{v}\|_{0,D_E^{(1)}}, & \|\nabla \mathbf{P}_C \mathbf{v}\|_{0,T} &\leq C \|\nabla \mathbf{v}\|_{0,D_T^{(1)}}, \\ \|\mathbf{v} - \mathbf{P}_C \mathbf{v}\|_{0,T} &\leq C h_T \|\mathbf{v}\|_{1,D_T^{(1)}}, & \|\mathbf{v} - \mathbf{P}_C \mathbf{v}\|_{0,E} &\leq C h_E^{1/2} \|\mathbf{v}\|_{1,D_E^{(1)}}. \end{aligned}$$

Further, we have

$$\begin{aligned} \left( \sum_{T \in \mathcal{T}_h} \|\mathbf{v}\|_{\mu, D_T^{(1)}}^2 \right)^{1/2} &\leq C \|\mathbf{v}\|_{\mu, \Omega}, \quad 0 \leq \mu \leq 1, \\ \left( \sum_{E \in \mathcal{E}_h(\Omega) \cup \mathcal{E}_h(\Gamma_N)} \|\mathbf{v}\|_{\mu, D_E^{(1)}}^2 \right)^{1/2} &\leq C \|\mathbf{v}\|_{\mu, \Omega}, \quad 0 \leq \mu \leq 1. \end{aligned}$$

where  $D_T^{(1)} := \cup \{ T' \in \mathcal{T}_h \mid \mathcal{N}_h(T') \cap \mathcal{N}_h(T) \neq \emptyset \}$ ,  $D_E^{(1)} := \cup \{ T' \in \mathcal{T}_h \mid \mathcal{N}_h(E) \cap \mathcal{N}_h(T') \neq \emptyset \}$ .

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Element and Edge Bubble Functions I

The element bubble function  $\psi_T$  is defined by means of the barycentric coordinates  $\lambda_i^T, 1 \leq i \leq 3$ , according to

$$\psi_T := 27 \lambda_1^T \lambda_2^T \lambda_3^T.$$

Note that  $\text{supp } \psi_T = T_{\text{int}}$ , i.e.,  $\psi_T|_{\partial T} = 0$ ,  $T \in \mathcal{T}_h$ . On the other hand, for  $E \in \mathcal{E}_h(\Omega) \cup \mathcal{E}_h(\Gamma_N)$  and  $T \in \mathcal{T}_h$  such that  $E \subset \partial T$  and  $p_i^E \in \mathcal{N}_h(E)$ ,  $1 \leq i \leq 2$ , we introduce the edge-bubble functions  $\psi_E$

$$\psi_E := 4 \lambda_1^T \lambda_2^T.$$

Note that  $\psi_E|_{E'} = 0$  for  $E' \in \mathcal{E}_h(T), E' \neq E$ .

## Element and Edge Bubble Functions II

The bubble functions  $\psi_T$  and  $\psi_E$  have the following important properties that can be easily verified taking advantage of the affine equivalence of the finite elements:

**Lemma.** There holds

$$\|\mathbf{p}_h\|_{0,T}^2 \leq C \int_T \mathbf{p}_h^2 \psi_T \, dx, \quad \mathbf{p}_h \in \mathbf{P}_1(T),$$

$$\|\mathbf{p}_h\|_{0,E}^2 \leq C \int_E \mathbf{p}_h^2 \psi_E \, d\sigma, \quad \mathbf{p}_h \in \mathbf{P}_1(E),$$

$$\|\mathbf{p}_h \psi_T\|_{1,T} \leq C h_T^{-1} \|\mathbf{p}_h\|_{0,T}, \quad \mathbf{p}_h \in \mathbf{P}_1(T),$$

$$\|\mathbf{p}_h \psi_T\|_{0,T} \leq C \|\mathbf{p}_h\|_{0,T}, \quad \mathbf{p}_h \in \mathbf{P}_1(T),$$

$$\|\mathbf{p}_h \psi_E\|_{0,E} \leq C \|\mathbf{p}_h\|_{0,E}, \quad \mathbf{p}_h \in \mathbf{P}_1(E).$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Element and Edge Bubble Functions III

For functions  $p_h \in P_1(\mathbf{E})$ ,  $\mathbf{E} \in \mathcal{E}_h(\Omega) \cup \mathcal{E}_h(\Gamma_N)$  we further need an extension  $p_h^{\mathbf{E}} \in L^2(\mathbf{T})$  where  $\mathbf{T} \in \mathcal{T}_h$  such that  $\mathbf{E} \subset \partial\mathbf{T}$ . For this purpose we fix some  $\mathbf{E}' \subset \partial\mathbf{T}$ ,  $\mathbf{E}' \neq \mathbf{E}$ , and for  $\mathbf{x} \in \mathbf{T}$  denote by  $\mathbf{x}_{\mathbf{E}}$  that point on  $\mathbf{E}$  such that  $(\mathbf{x} - \mathbf{x}_{\mathbf{E}}) \parallel \mathbf{E}'$ . For  $p_h \in P_1(\mathbf{E})$  we then set

$$p_h^{\mathbf{E}} := p_h(\mathbf{x}_{\mathbf{E}}).$$

Further, for  $\mathbf{E} \in \mathcal{E}_h(\Omega) \cup \mathcal{E}_h(\Gamma_N)$  we define  $D_{\mathbf{E}}^{(2)}$  as the union of elements  $\mathbf{T} \in \mathcal{T}_h$  containing  $\mathbf{E}$  as a common edge

$$D_{\mathbf{E}}^{(2)} := \bigcup \{ \mathbf{T} \in \mathcal{T}_h \mid \mathbf{E} \in \mathcal{E}_h(\mathbf{T}) \}.$$

## Element and Edge Bubble Functions IV

**Lemma.** There holds

$$|p_h^E \psi_E|_{1, D_E^{(2)}} \leq C h_E^{-1/2} \|p_h\|_{0, e}, \quad p_h \in P_1(E),$$

$$\|p_h^E \psi_E\|_{0, D_E^{(2)}} \leq C h_E^{1/2} \|p_h\|_{0, E}, \quad p_h \in P_1(E).$$

Further, for all  $v \in V$  and  $\mu = 0, 1$  there holds

$$\left( \sum_{E \in \mathcal{E}_h(\Omega) \cup \mathcal{E}_h(\Gamma_N)} h_E^{1-\mu} \|v\|_{\mu, D_E^{(2)}}^2 \right)^{1/2} \leq C \left( \sum_{T \in \mathcal{T}_h} h_T^{1-\mu} \|v\|_{\mu, T}^2 \right)^{1/2}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Step MARK of the Adaptive Cycle: Bulk Criterion

Given a universal constant  $0 < \Theta < 1$ , specify a set  $\mathcal{M}_T$  of elements and a set  $\mathcal{M}_E$  of edges such that (bulk criterion, Dörfler marking)

$$\Theta \left( \sum_{T \in \mathcal{T}_H(\Omega)} \eta_T^2 + \sum_{E \in \mathcal{E}_H(\Omega)} \eta_E^2 \right) \leq \sum_{T \in \mathcal{M}_T} \eta_T^2 + \sum_{E \in \mathcal{M}_E} \eta_E^2 .$$

## Step REFINE of the Adaptive Cycle: Refinement Rules

- Any  $T \in \mathcal{M}_T, E \in \mathcal{M}_E$  is refined by bisection.
- Further bisection is used to create a geometrically conforming triangulation  $\mathcal{T}_h(\Omega)$ .

Department of Mathematics, University of Houston

## Elliptic Optimal Control Problems: Unconstrained Case

Let  $\Omega$  be a bounded polygonal domain with boundary  $\Gamma = \partial\Omega$ . Given a desired state  $y^d \in L^2(\Omega)$ ,  $f \in L^2\Omega$ , and  $\alpha > 0$ , find  $(y, u) \in H_0^1(\Omega) \times L^2(\Omega)$  such that

$$\inf_{(y, u)} J(y, u) := \frac{1}{2} \int_{\Omega} |y - y^d|^2 \, dx + \frac{\alpha}{2} \int_{\Omega} |u|^2 \, dx,$$

$$\text{subject to } \begin{aligned} -\Delta y &= u && \text{in } \Omega, \\ y &= 0 && \text{on } \Gamma. \end{aligned}$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Reduced Optimality Conditions in $y$ and $p$

Substituting  $u$  in the state equation by  $p = \alpha u$ , we arrive at the following system of two variational equations:

$$\begin{aligned} a(y, v) - \alpha^{-1}(p, v)_{0,\Omega} &= \ell_1(v), \quad v \in V := H_0^1(\Omega), \\ a(p, w) + (y, w)_{0,\Omega} &= \ell_2(w), \quad w \in V, \end{aligned}$$

where the functionals  $\ell_\nu : V \rightarrow \mathbb{R}$ ,  $1 \leq \nu \leq 2$ , are given by

$$\ell_1(v) := 0, \quad v \in V, \quad \ell_2(w) := (y^d, w)_{0,\Omega}, \quad w \in V.$$

The operator-theoretic formulation reads

$$\mathcal{L}(y, p) = (\ell_1, \ell_2)^T,$$

where the operator  $\mathcal{L} : V \times V \rightarrow V^* \times V^*$  is defined according to

$$(\mathcal{L}(y, p))(v, w) := a(y, v) - \alpha^{-1}(p, v)_{0,\Omega} + a(p, w) + (y, w)_{0,\Omega}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Operator Theoretic Formulation of the Optimality System I

**Theorem.** The operator  $\mathcal{L}$  is a continuous, bijective linear operator. Hence, for any  $(\ell_1, \ell_2) \in V^* \times V^*$  the system admits a unique solution  $(\mathbf{y}, \mathbf{p}) \in V \times V$ . The solution depends continuously on the data according to

$$\|(\mathbf{y}, \mathbf{p})\|_{V \times V} \leq C \|(\ell_1, \ell_2)\|_{V^* \times V^*}.$$

**Proof.** The linearity and continuity are straightforward. For the proof of the inf-sup condition, we choose  $\mathbf{v} = \alpha \mathbf{y} - \mathbf{p}$  and  $\mathbf{w} = \mathbf{p} + \mathbf{y}$ . It follows that

$$(\mathcal{L}(\mathbf{y}, \mathbf{p}))(\alpha \mathbf{y} - \mathbf{p}, \mathbf{y} + \mathbf{p}) = \alpha a(\mathbf{y}, \mathbf{y}) + a(\mathbf{p}, \mathbf{p}) + (\mathbf{y}, \mathbf{y})_{0,\Omega} + \alpha^{-1} (\mathbf{p}, \mathbf{p})_{0,\Omega},$$

which allows to conclude.

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Operator Theoretic Formulation of the Optimality System II

**Corollary.** Let  $(\mathbf{y}_h, \mathbf{p}_h) \in \mathbf{V}_h \times \mathbf{V}_h$ ,  $\mathbf{V}_h \subset \mathbf{V}$ , be an approximate solution of  $(\mathbf{y}, \mathbf{p}) \in \mathbf{V} \times \mathbf{V}$ .

Then, there holds

$$\|(\mathbf{y} - \mathbf{y}_h, \mathbf{p} - \mathbf{p}_h)\|_{\mathbf{V} \times \mathbf{V}} \leq C \|(\mathbf{Res}_1, \mathbf{Res}_2)\|_{\mathbf{V}^* \times \mathbf{V}^*},$$

where the residuals  $\mathbf{Res}_1 \in \mathbf{V}^*$ ,  $\mathbf{Res}_2 \in \mathbf{V}^*$  are given by

$$\begin{aligned} \mathbf{Res}_1(\mathbf{v}) &:= \ell_1(\mathbf{v}) - \mathbf{a}(\mathbf{y}_h, \mathbf{v}) + \alpha^{-1}(\mathbf{p}_h, \mathbf{v})_{0,\Omega}, \quad \mathbf{v} \in \mathbf{V}, \\ \mathbf{Res}_2(\mathbf{w}) &:= \ell_2(\mathbf{w}) - \mathbf{a}(\mathbf{p}_h, \mathbf{w}) - (\mathbf{y}_h, \mathbf{w})_{0,\Omega}, \quad \mathbf{w} \in \mathbf{W}. \end{aligned}$$

**Proof.** The assertion is an immediate consequence of the previous theorem.

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

Using Galerkin orthogonality and Clément's quasi-interpolation operator  $\mathbf{P}_C$ , for the first residual  $\mathbf{Res}_1$  we find

$$\mathbf{Res}_1(\mathbf{v}) = \sum_{T \in \mathcal{T}_h(\Omega)} (\mathbf{f}, \mathbf{v} - \mathbf{P}_C \mathbf{v})_{0,T} - \sum_{T \in \mathcal{T}_h(\Omega)} \left( \mathbf{a}(\mathbf{u}_h, \mathbf{v} - \mathbf{P}_C \mathbf{v}) + \alpha^{-1} (\mathbf{p}_h, \mathbf{v} - \mathbf{P}_C \mathbf{v})_{0,T} \right).$$

By an elementwise application of Green's formula and the local approximation properties of  $\mathbf{P}_C$  it follows that

$$\|\mathbf{Res}_1\|_{\mathbf{V}^*} \leq C \left( \sum_{T \in \mathcal{T}_h(\Omega)} \eta_{T,1}^2 + \sum_{E \in \mathcal{E}_h(\Omega)} \eta_{E,1}^2 \right)^{1/2},$$

The local residuals are given by

$$\begin{aligned} \eta_{T,1} &:= \mathbf{h}_T \|\Delta \mathbf{y}_h + \mathbf{u}_h\|_{0,T}, \\ \eta_{E,1} &:= \mathbf{h}_E^{1/2} \|\mathbf{n} \cdot [\nabla \mathbf{y}_h]\|_{0,E}. \end{aligned}$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

Likewise, for the second residual  $\mathbf{Res}_2$  we obtain

$$\|\mathbf{Res}_2\|_{\mathbf{V}^*} \leq C \left( \sum_{\mathbf{T} \in \mathcal{T}_h(\Omega)} \eta_{\mathbf{T},2}^2 + \sum_{\mathbf{E} \in \mathcal{E}_h(\Omega)} \eta_{\mathbf{E},2}^2 \right)^{1/2},$$

where the local residuals are given by

$$\begin{aligned} \eta_{\mathbf{T},2} &:= h_{\mathbf{T}} \|y^d + \Delta p_h - y_h\|_{0,\mathbf{T}}, \quad \mathbf{T} \in \mathcal{T}_h(\Omega), \\ \eta_{\mathbf{E},2} &:= h_{\mathbf{E}}^{1/2} \|\mathbf{n} \cdot [\nabla p_h]\|_{0,\mathbf{E}}, \quad \mathbf{E} \in \mathcal{E}_h(\Omega). \end{aligned}$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Reliability of the Residual-Type A Posteriori Error Estimator

**Theorem.** Let  $(\mathbf{y}, \mathbf{p}) \in \mathbf{V} \times \mathbf{V}$  and  $(\mathbf{y}_h, \mathbf{p}_h) \in \mathbf{V}_h \times \mathbf{V}_h$  be the solutions of the continuous and discrete optimality system, respectively. Then, there holds

$$\|(\mathbf{y} - \mathbf{y}_h, \mathbf{p} - \mathbf{p}_h)\|_{\mathbf{V} \times \mathbf{V}} \leq C\eta_h,$$

where the estimator  $\eta_h$  is given by

$$\eta_h := \left( \sum_{\mathbf{T} \in \mathcal{T}_h(\Omega)} (\eta_{\mathbf{T},1}^2 + \eta_{\mathbf{T},2}^2) + \sum_{\mathbf{E} \in \mathcal{E}_h(\Omega)} (\eta_{\mathbf{E},1}^2 + \eta_{\mathbf{E},2}^2) \right)^{1/2}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Efficiency of the Residual-Type A Posteriori Error Estimator I

**Lemma.** Let  $(\mathbf{y}, \mathbf{p}) \in \mathbf{V} \times \mathbf{V}$  and  $(\mathbf{y}_h, \mathbf{p}_h) \in \mathbf{V}_h \times \mathbf{V}_h$  be the solutions of the continuous and discrete optimality system, respectively. Then, there exists a positive constant  $\mathbf{c}$  depending only on the shape regularity of  $\{\mathcal{T}_h(\Omega)\}$  such that for  $\mathbf{T} \in \mathcal{T}_h(\Omega)$

$$\eta_{\mathbf{T},1}^2 \leq \mathbf{c} (|\mathbf{y} - \mathbf{y}_h|_{1,\mathbf{T}}^2 + h_{\mathbf{T}}^2 \|\mathbf{u} - \mathbf{u}_h\|_{0,\mathbf{T}}^2).$$

**Proof.** Setting  $\mathbf{z}_h := \mathbf{u}_h|_{\mathbf{T}}\psi_{\mathbf{T}}$  and observing that  $\Delta \mathbf{y}_h|_{\mathbf{T}} = \mathbf{0}$ , Green's formula and the fact that  $\mathbf{z}_h$  is an admissible test function imply

$$\begin{aligned} \eta_{\mathbf{T},1}^2 &= h_{\mathbf{T}}^2 \|\mathbf{u}_h\|_{0,\mathbf{T}}^2 \leq \mathbf{c} h_{\mathbf{T}}^2 (\mathbf{u}_h + \Delta \mathbf{y}_h, \mathbf{z}_h)_{0,\mathbf{T}} = \mathbf{c} h_{\mathbf{T}}^2 (-\mathbf{a}(\mathbf{y}_h, \mathbf{z}_h) + (\mathbf{u}, \mathbf{z}_h)_{0,\mathbf{T}} \\ &+ (\mathbf{u}_h - \mathbf{u}, \mathbf{z}_h)_{0,\mathbf{T}}) = \mathbf{c} h_{\mathbf{T}}^2 (\mathbf{a}(\mathbf{y} - \mathbf{y}_h, \mathbf{z}_h) + (\mathbf{u}_h - \mathbf{u}, \mathbf{z}_h)_{0,\mathbf{T}}) \\ &\leq \mathbf{c} (h_{\mathbf{T}}^2 |\mathbf{y} - \mathbf{y}_h|_{1,\mathbf{T}} |\mathbf{z}_h|_{1,\mathbf{T}} + h_{\mathbf{T}}^2 \|\mathbf{u} - \mathbf{u}_h\|_{0,\mathbf{T}} \|\mathbf{z}_h\|_{0,\mathbf{T}}). \end{aligned}$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

**Proof cont'd.** By the property of the element bubble function

$$|p_h \psi_T|_{1,T} \leq c h_T^{-1} \|p_h\|_{0,T}, \quad p_h \in P_1(T),$$

and Young's inequality we obtain

$$h_T^2 \|u_h\|_{0,T}^2 \leq c(|y - y_h|_{1,T}^2 + h_T^2 \|u - u_h\|_{0,T}^2) + \frac{1}{2} h_T^2 \|u_h\|_{0,T}^2,$$

which gives the assertion.

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Efficiency of the Residual-Type A Posteriori Error Estimator II

**Lemma.** Let  $(\mathbf{y}, \mathbf{p}) \in \mathbf{V} \times \mathbf{V}$  and  $(\mathbf{y}_h, \mathbf{p}_h) \in \mathbf{V}_h \times \mathbf{V}_h$  be the solutions of the continuous and discrete optimality system, respectively. Then, there exists a positive constant  $\mathbf{c}$  depending only on the shape regularity of  $\{\mathcal{T}_h(\Omega)\}$  such that for  $\mathbf{T} \in \mathcal{T}_h(\Omega)$

$$\eta_{\mathbf{T},2}^2 \leq \mathbf{c} (|\mathbf{p} - \mathbf{p}_h|_{1,\mathbf{T}}^2 + h_{\mathbf{T}}^2 \|\mathbf{y} - \mathbf{y}_h\|_{0,\mathbf{T}}^2 + \text{osc}_{\mathbf{T}}^2),$$

where

$$\text{osc}_{\mathbf{T}} := h_{\mathbf{T}} \|\mathbf{y}^d - \mathbf{y}_h^d\|_{0,\mathbf{T}}, \quad \mathbf{T} \in \mathcal{T}_h(\Omega).$$

**Proof.** The assertion can be proved along the same lines as in the previous lemma.

## Efficiency of the Residual-Type A Posteriori Error Estimator III

**Lemma.** Let  $(\mathbf{y}, \mathbf{p}) \in \mathbf{V} \times \mathbf{V}$  and  $(\mathbf{y}_h, \mathbf{p}_h) \in \mathbf{V}_h \times \mathbf{V}_h$  be the solutions of the continuous and discrete optimality system, respectively. Then, there exists a positive constant  $\mathbf{c}$  depending only on the shape regularity of  $\{\mathcal{T}_h(\Omega)\}$  such that for  $\mathbf{E} \in \mathcal{E}_h(\Omega)$

$$\eta_{\mathbf{E},1}^2 \leq \mathbf{c} (|\mathbf{y} - \mathbf{y}_h|_{1,\omega_{\mathbf{E}}}^2 + \mathbf{h}_{\mathbf{E}}^2 \|\mathbf{u} - \mathbf{u}_h\|_{0,\omega_{\mathbf{E}}}^2 + \sum_{\nu=1}^2 \eta_{\mathbf{T}_{\nu},1}^2) .$$

**Proof.** We set  $\zeta_{\mathbf{E}} := (\mathbf{n}_{\mathbf{E}} \cdot [\nabla \mathbf{y}_h])|_{\mathbf{E}}$  and  $\mathbf{z}_h := \tilde{\zeta}_{\mathbf{E}} \psi_{\mathbf{E}}$ . Then, applying Green's formula and observing that  $\mathbf{z}_h$  is an admissible test function, we find

$$\begin{aligned} \eta_{\mathbf{E},1}^2 &= \mathbf{h}_{\mathbf{E}} \|\mathbf{n}_{\mathbf{E}} \cdot [\nabla \mathbf{y}_h]\|_{0,\mathbf{E}}^2 \leq \mathbf{c} \mathbf{h}_{\mathbf{E}} (\mathbf{n}_{\mathbf{E}} \cdot [\nabla \mathbf{y}_h], \zeta_{\mathbf{E}} \psi_{\mathbf{E}})_{0,\mathbf{E}} = \mathbf{c} \mathbf{h}_{\mathbf{E}} \sum_{\nu=1}^2 (\mathbf{n}_{\partial \mathbf{T}_{\nu}} \cdot [\nabla \mathbf{y}_h], \mathbf{z}_h)_{0,\partial \mathbf{T}_{\nu}} \\ &= \mathbf{c} \mathbf{h}_{\mathbf{E}} (\mathbf{a}(\mathbf{y}_h - \mathbf{y}, \mathbf{z}_h) + (\mathbf{u} - \mathbf{u}_h, \mathbf{z}_h)_{0,\omega_{\mathbf{E}}} + (\mathbf{f} + \mathbf{u}_h, \mathbf{z}_h)_{0,\omega_{\mathbf{E}}}) \\ &\leq \mathbf{c} \mathbf{h}_{\mathbf{E}}^{1/2} \|\nu_{\mathbf{E}} \cdot [\nabla \mathbf{y}_h]\|_{0,\mathbf{E}} (|\mathbf{y} - \mathbf{y}_h|_{1,\omega_{\mathbf{E}}} (\mathbf{h}_{\mathbf{E}} \|\mathbf{u} - \mathbf{u}_h\|_{0,\omega_{\mathbf{E}}} + (\sum_{\nu=1}^2 \eta_{\mathbf{T}_{\nu},1}^2)^{1/2})), \end{aligned}$$

which allows to conclude.

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Efficiency of the Residual-Type A Posteriori Error Estimator IV

**Lemma.** Let  $(\mathbf{y}, \mathbf{p}) \in \mathbf{V} \times \mathbf{V}$  and  $(\mathbf{y}_h, \mathbf{p}_h) \in \mathbf{V}_h \times \mathbf{V}_h$  be the solutions of the continuous and discrete optimality system, respectively. Then, there exists a positive constant  $c$  depending only on the shape regularity of  $\{\mathcal{T}_h(\Omega)\}$  such that for  $\mathbf{E} \in \mathcal{E}_h(\Omega)$

$$\eta_{\mathbf{E},2}^2 \leq c(|\mathbf{p} - \mathbf{p}_h|_{1,\omega_{\mathbf{E}}}^2 + h_{\mathbf{E}}^2 \|\mathbf{y} - \mathbf{y}_h\|_{0,\omega_{\mathbf{E}}}^2 + \sum_{\nu=1}^2 \eta_{\mathbf{T}_{\nu},2}^2) .$$

**Proof.** The proof is similar to the one in the previous lemma.

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Efficiency of the Residual-Type A Posteriori Error Estimator $V$

**Theorem.** Let  $(\mathbf{y}, \mathbf{p}) \in V \times V$  and  $(\mathbf{y}_h, \mathbf{p}_h) \in V_h \times V_h$  be the solutions of the continuous and discrete optimality system, respectively. Then, there exist positive constants  $C$  and  $c$  depending only on  $\Omega$  and the shape regularity of the triangulations such that

$$\|(\mathbf{y} - \mathbf{y}_h, \mathbf{p} - \mathbf{p}_h)\|_{V \times V}^2 + \|\mathbf{u} - \mathbf{u}_h\|_{0, \Omega}^2 \geq C \eta_h^2 - c \operatorname{osc}_h^2.$$

where

$$\operatorname{osc}_h^2 := \sum_{T \in \mathcal{T}_h(\Omega)} \operatorname{osc}_T^2.$$

**Proof.** Combining the results of the previous four lemmas gives the assertion.

Institut für Mathematik, Universität Augsburg

## Model Problem (Distributed Elliptic Control Problem with Control Constraints)

Given a bounded domain  $\Omega \subset \mathbb{R}^2$  with polygonal boundary  $\Gamma = \partial\Omega$ , functions  $y^d, \psi \in L^2(\Omega)$ , and  $\alpha > 0$ , consider the distributed optimal control problem

$$\begin{aligned} \text{Minimize} \quad & J(y, u) := \frac{1}{2} \|y - y^d\|_{0,\Omega}^2 + \frac{\alpha}{2} \|u\|_{0,\Omega}^2, \\ \text{over} \quad & (y, u) \in H_0^1(\Omega) \times L^2(\Omega), \\ \text{subject to} \quad & -\Delta y = u, \\ & u \in K := \{v \in L^2(\Omega) \mid v \leq \psi \text{ a.e. in } \Omega\}. \end{aligned}$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Optimality Conditions for the Distributed Control Problem

There exists an **adjoint state**  $\mathbf{p} \in \mathbf{H}_0^1(\Omega)$  and an **adjoint control**  $\boldsymbol{\lambda} \in \mathbf{L}^2(\Omega)$  such that the quadruple  $(\mathbf{y}, \mathbf{p}, \mathbf{u}, \boldsymbol{\lambda})$  satisfies

$$\mathbf{a}(\mathbf{y}, \mathbf{v}) = (\mathbf{u}, \mathbf{v})_{0, \Omega} \quad , \quad \mathbf{v} \in \mathbf{H}_0^1(\Omega) \quad ,$$

$$\mathbf{a}(\mathbf{p}, \mathbf{v}) = - (\mathbf{y} - \mathbf{y}^d, \mathbf{v})_{0, \Omega} \quad , \quad \mathbf{v} \in \mathbf{H}_0^1(\Omega) \quad ,$$

$$\mathbf{p} = \boldsymbol{\alpha} \mathbf{u} + \boldsymbol{\lambda} \quad ,$$

$$\boldsymbol{\lambda} \in \partial \mathbf{I}_K(\mathbf{u}) \quad .$$

In particular, the following complementarity conditions hold true:

$$\boldsymbol{\lambda} \in \mathbf{L}_+^2(\Omega), \quad \boldsymbol{\psi} - \mathbf{u} \geq 0, \quad (\boldsymbol{\lambda}, \boldsymbol{\psi} - \mathbf{u})_{0, \Omega} = 0.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Finite Element Approximation of the Distributed Control Problem

Let  $\mathcal{T}_H(\Omega)$  be a **shape regular, simplicial triangulation** of  $\Omega$  and let

$$\mathbf{V}_H := \{ \mathbf{v}_H \in \mathbf{C}(\Omega) \mid \mathbf{v}_H|_T \in \mathbf{P}_1(T), T \in \mathcal{T}_H(\Omega), \mathbf{v}_H|_{\partial\Omega} = \mathbf{0} \}$$

be the FE space of **continuous, piecewise linear finite elements**.

Consider the following **FE Approximation** of the distributed control problem

$$\text{Minimize} \quad \mathbf{J}(\mathbf{y}_h, \mathbf{u}_h) := \frac{1}{2} \|\mathbf{y}_h - \mathbf{y}^d\|_{0,\Omega}^2 + \frac{\alpha}{2} \|\mathbf{u}_h\|_{0,\Omega}^2,$$

$$\text{over} \quad (\mathbf{y}_h, \mathbf{u}_h) \in \mathbf{V}_h \times \mathbf{V}_h,$$

$$\text{subject to} \quad \mathbf{a}(\mathbf{y}_h, \mathbf{v}_h) = (\mathbf{u}_h, \mathbf{v}_h)_{0,\Omega}, \mathbf{v}_h \in \mathbf{V}_h,$$

$$\mathbf{u}_h \in \mathbf{K}_h := \{ \mathbf{v}_h \in \mathbf{V}_h \mid \mathbf{v}_h \leq \psi \text{ a.e. in } \Omega \}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Optimality Conditions for the FE Discretized Control Problem

There exists an **adjoint state**  $\mathbf{p}_h \in \mathbf{V}_h$  and an **adjoint control**  $\boldsymbol{\lambda}_h \in \mathbf{V}_h$  such that the quadruple  $(\mathbf{y}_h, \mathbf{p}_h, \mathbf{u}_h, \boldsymbol{\lambda}_h)$  satisfies

$$\begin{aligned} \mathbf{a}(\mathbf{y}_h, \mathbf{v}_h) &= (\mathbf{u}_h, \mathbf{v}_h)_{0,\Omega} \quad , \quad \mathbf{v}_h \in \mathbf{V}_h \quad , \\ \mathbf{a}(\mathbf{p}_h, \mathbf{v}_h) &= - (\mathbf{y}_h - \mathbf{y}^d, \mathbf{v}_h)_{0,\Omega} \quad , \quad \mathbf{v}_h \in \mathbf{V}_h \quad , \\ \mathbf{p}_h &= \alpha \mathbf{u}_h + \boldsymbol{\lambda}_h \quad , \\ \boldsymbol{\lambda}_h &\in \partial \mathbf{I}_{K_h}(\mathbf{u}_h) \quad . \end{aligned}$$

The following complementarity conditions hold true:

$$\boldsymbol{\lambda}_h \geq 0, \quad \psi - \mathbf{u}_h \geq 0, \quad (\boldsymbol{\lambda}_h, \psi - \mathbf{u}_h)_{0,\Omega} = 0.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## The A Posteriori Error Estimator

## Element and Edge Residuals for the State and the Adjoint State

(i) Element and edge residuals for the state  $y$

$$\eta_y := \left( \sum_{T \in \mathcal{T}_h(\Omega)} \eta_{y,T}^2 + \sum_{E \in \mathcal{E}_h(\Omega)} \eta_{y,E}^2 \right)^{1/2}$$

$$\eta_{y,T} := \underbrace{h_T \|u_h\|_{0,T}}_{\text{element residuals}}, \quad T \in \mathcal{T}_h(\Omega), \quad \eta_{y,E} := \underbrace{h_E^{1/2} \|\nu_E \cdot [\nabla y_h]\|_{0,E}}_{\text{edge residuals}}, \quad E \in \mathcal{E}_h(\Omega)$$

(ii) Element and edge residuals for the adjoint state  $p$

$$\eta_p := \left( \sum_{T \in \mathcal{T}_h(\Omega)} \eta_{p,T}^2 + \sum_{E \in \mathcal{E}_h(\Omega)} \eta_{p,E}^2 \right)^{1/2}$$

$$\eta_{p,T}^{(1)} := \underbrace{h_T \|y^d - y_h\|_{0,T}}_{\text{element residuals}}, \quad \eta_{p,E} := \underbrace{h_E^{1/2} \|\nu_E \cdot [\nabla p_h]\|_{0,E}}_{\text{edge residuals}}, \quad E \in \mathcal{E}_h(\Omega)$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Reliability of the Error Estimator

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Reliability of the A Posteriori Error Estimator

**Theorem** Let  $(\mathbf{y}, \mathbf{p}, \mathbf{u}, \boldsymbol{\lambda})$  be the solution of the distributed control problem and  $(\mathbf{y}_h, \mathbf{p}_h, \mathbf{u}_h, \boldsymbol{\lambda}_h)$  be the finite element approximation with respect to the triangulation  $\mathcal{T}_h(\Omega)$ . Further, let  $\eta$  be the residual type error estimator.

Then, there exists a positive constant  $C$ , depending only on  $\alpha$ ,  $\Omega$  and on the shape regularity of the triangulation  $\mathcal{T}_h(\Omega)$  such that

$$|\mathbf{y} - \mathbf{y}_h|_{1,\Omega}^2 + |\mathbf{p} - \mathbf{p}_h|_{1,\Omega}^2 + \|\mathbf{u} - \mathbf{u}_h\|_{0,\Omega}^2 + \|\boldsymbol{\lambda} - \boldsymbol{\lambda}_h\|_{0,\Omega}^2 \leq C \eta^2.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Important Tool in the Error Analysis: Intermediate State and Adjoint State

Given a discrete control  $\mathbf{u}_h \in \mathbf{V}_h$ , the **intermediate state**  $\mathbf{y}(\mathbf{u}_h) \in \mathbf{H}_0^1(\Omega)$  and the **intermediate adjoint state**  $\mathbf{p}(\mathbf{u}_h) \in \mathbf{H}_0^1(\Omega)$  are the unique solutions of the variational equations

$$\begin{aligned} \mathbf{a}(\mathbf{y}(\mathbf{u}_h), \mathbf{v}) &= (\mathbf{u}_h, \mathbf{v})_{0,\Omega} \quad , \quad \mathbf{v} \in \mathbf{H}_0^1(\Omega) \quad , \\ \mathbf{a}(\mathbf{p}(\mathbf{u}_h), \mathbf{v}) &= - (\mathbf{y}(\mathbf{u}_h) - \mathbf{y}^d, \mathbf{v})_{0,\Omega} \quad , \quad \mathbf{v} \in \mathbf{H}_0^1(\Omega) \quad . \end{aligned}$$

**Lemma.** Let  $\mathbf{y}(\mathbf{u}_h)$  and  $\mathbf{p}(\mathbf{u}_h)$  be the intermediate state and adjoint state. Then, we have

$$(\mathbf{p} - \mathbf{p}(\mathbf{u}_h), \mathbf{u} - \mathbf{u}_h)_{0,\Omega} = - \|\mathbf{y} - \mathbf{y}(\mathbf{u}_h)\|_{0,\Omega}^2 \leq 0 \quad .$$

**Proof:** Obviously, there holds

$$\mathbf{a}(\mathbf{y} - \mathbf{y}(\mathbf{u}_h), \mathbf{v}_1) = (\mathbf{u} - \mathbf{u}_h, \mathbf{v}_1)_{0,\Omega} \quad , \quad \mathbf{a}(\mathbf{p} - \mathbf{p}(\mathbf{u}_h), \mathbf{v}_2) = (\mathbf{y}(\mathbf{u}_h) - \mathbf{y}, \mathbf{v}_2)_{0,\Omega} \quad , \quad \mathbf{v}_1, \mathbf{v}_2 \in \mathbf{H}_0^1(\Omega) \quad .$$

The assertion follows readily by choosing  $\mathbf{v}_1 := \mathbf{p} - \mathbf{p}(\mathbf{u}_h)$  and  $\mathbf{v}_2 := \mathbf{y} - \mathbf{y}(\mathbf{u}_h)$ .

**Proof.** Since  $\mathbf{u} = \alpha^{-1}(\mathbf{p} - \boldsymbol{\lambda})$ ,  $\mathbf{u}_h = \alpha^{-1}(\mathbf{p}_h - \boldsymbol{\lambda}_h)$ , we have

$$\alpha \|\mathbf{u} - \mathbf{u}_h\|_{0,\Omega}^2 = (\boldsymbol{\lambda}_h - \boldsymbol{\lambda}, \mathbf{u} - \mathbf{u}_h)_{0,\Omega} + (\mathbf{p} - \mathbf{p}_h, \mathbf{u} - \mathbf{u}_h)_{0,\Omega}.$$

Using the complementarity conditions for  $\boldsymbol{\lambda}$  and  $\boldsymbol{\lambda}_h$ , we find

$$\begin{aligned} (\boldsymbol{\lambda}_h - \boldsymbol{\lambda}, \mathbf{u} - \mathbf{u}_h)_{0,\Omega} &= \underbrace{(\boldsymbol{\lambda}_h, \mathbf{u} - \boldsymbol{\psi})_{0,\Omega}}_{\leq 0} + \underbrace{(\boldsymbol{\sigma}_h, \boldsymbol{\psi} - \mathbf{u}_H)_{0,\Omega}}_{= 0} \\ &\quad - \underbrace{(\boldsymbol{\lambda}, \mathbf{u} - \boldsymbol{\psi})_{0,\Omega}}_{= 0} - \underbrace{(\boldsymbol{\lambda}, \boldsymbol{\psi} - \mathbf{u}_h)_{0,\Omega}}_{\geq 0} \leq 0. \end{aligned}$$

Moreover, for the remaining term there holds

$$(\mathbf{p} - \mathbf{p}_h, \mathbf{u} - \mathbf{u}_h)_{0,\Omega} \leq \underbrace{(\mathbf{p} - \mathbf{p}(\mathbf{u}_h), \mathbf{u} - \mathbf{u}_h)_{0,\Omega}}_{\leq 0} + (\mathbf{p}(\mathbf{u}_h) - \mathbf{p}_h, \mathbf{u} - \mathbf{u}_h)_{0,\Omega},$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Numerical Example: Distributed Control Problem with Control Constraints

$$\begin{aligned} \text{Minimize} \quad & J(\mathbf{y}, \mathbf{u}) := \frac{1}{2} \|\mathbf{y} - \mathbf{y}^d\|_{0,\Omega}^2 + \frac{\alpha}{2} \|\mathbf{u} - \mathbf{u}^d\|_{0,\Omega}^2, \\ \text{over} \quad & (\mathbf{y}, \mathbf{u}) \in H_0^1(\Omega) \times L^2(\Omega), \\ \text{subject to} \quad & -\Delta \mathbf{y} = \mathbf{f} + \mathbf{u}, \\ & \mathbf{u} \in \mathbf{K} := \{\mathbf{v} \in L^2(\Omega) \mid \mathbf{v} \leq \psi \text{ a.e. in } \Omega\}. \end{aligned}$$

Data:

$$\mathbf{y}^d := \sin(2\pi x_1) \sin(2\pi x_2) \exp(2x_1)/6 ,$$

$$\alpha := 0.01 , \quad \mathbf{u}^d := \mathbf{0} , \quad \psi := \mathbf{0} , \quad \mathbf{f} := \mathbf{0} .$$

## Goal-Oriented Dual Weighted Approach

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Goal-Oriented Dual Weighted Approach I

The goal oriented dual weighted approach allows to control the error  $\mathbf{e}_u := \mathbf{u} - \mathbf{u}_h$  with respect to a rather general error functional or output functional

$$\mathbf{J} : \mathbf{V} \subseteq \mathbf{H}^1(\Omega) \rightarrow \mathbb{R}.$$

The goal oriented dual weighted approach strongly uses the solution  $\mathbf{z} \in \mathbf{V}$  of the associated dual problem

$$\mathbf{a}(\mathbf{v}, \mathbf{z}) = \mathbf{J}(\mathbf{v}) \quad , \quad \mathbf{v} \in \mathbf{V},$$

and its finite element approximation  $\mathbf{z}_h \in \mathbf{V}_h$ , i.e.,

$$\mathbf{a}(\mathbf{v}_h, \mathbf{z}_h) = \mathbf{J}(\mathbf{v}_h), \quad \mathbf{v}_h \in \mathbf{V}_h.$$

Using Galerkin orthogonality, we readily deduce that

$$\mathbf{J}(\mathbf{e}_u) = \mathbf{a}(\mathbf{e}_u, \mathbf{z}) = \mathbf{a}(\mathbf{e}_u, \mathbf{z} - \mathbf{v}_h) = \mathbf{r}(\mathbf{z} - \mathbf{v}_h), \quad \mathbf{v}_h \in \mathbf{V}_h,$$

where  $\mathbf{r}(\cdot)$  stands for the residual with respect to the computed finite element approximation  $\mathbf{u}_h$ .

## Goal-Oriented Dual Weighted Approach II

**Theorem.** Let  $\mathbf{u}_h \in \mathbf{V}_h := \mathbf{S}_{1,\Gamma}(\Omega; \mathcal{T}_h(\Omega))$  be the conforming P1 approximation of the solution  $\mathbf{u} \in \mathbf{H}_0^1(\Omega)$  of Poisson's equation with  $\mathbf{f} \in \mathbf{L}^2(\Omega)$  and homogeneous Dirichlet boundary data. Then, the following error representation holds true

$$\mathbf{J}(\mathbf{e}_u) = \sum_{\mathbf{T} \in \mathcal{T}_h(\Omega)} \left( (\mathbf{r}_T, \mathbf{z} - \mathbf{v}_h)_{0,T} + (\mathbf{r}_{\partial T}, \mathbf{z} - \mathbf{v}_h)_{0,\partial T} \right), \quad \mathbf{v}_h \in \mathbf{V}_h,$$

where the element residuals  $\mathbf{r}_T$  and the edges residuals  $\mathbf{r}_{\partial T}$  are given by

$$\mathbf{r}_T := \mathbf{f}, \quad \mathbf{T} \in \mathcal{T}_h(\Omega), \quad \mathbf{r}_{\partial T}|_E := \begin{cases} \frac{1}{2} \boldsymbol{\nu}_E \cdot [\nabla \mathbf{u}_h], & E \in \mathcal{E}_h(\partial \mathbf{T} \cap \Omega) \\ \mathbf{0}, & E \in \mathcal{E}_h(\partial \mathbf{T} \cap \Gamma) \end{cases}$$

Moreover, we have the error estimate

$$|\mathbf{J}(\mathbf{e}_u)| \leq \eta_{\text{DW}} := \sum_{\mathbf{T} \in \mathcal{T}_h(\Omega)} \omega_T \rho_T,$$

where for  $\mathbf{v}_h \in \mathbf{V}_h$  the element residuals  $\rho_T$  and the weights  $\omega_T$  read

$$\rho_T := \left( \|\mathbf{r}_T\|_{0,T}^2 + \mathbf{h}_T^{-1} \|\mathbf{r}_{\partial T}\|_{0,\partial T}^2 \right)^{1/2}, \quad \omega_T := \left( \|\mathbf{z} - \mathbf{v}_h\|_{0,T}^2 + \mathbf{h}_T \|\mathbf{z} - \mathbf{v}_h\|_{0,\partial T}^2 \right)^{1/2}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Goal-Oriented Dual Weighted Approach III

We remark that the previous result is not really a posteriori, since the solution  $\mathbf{z} \in \mathbf{V}$  of the dual solution is not known. Therefore, information about the weights  $\omega_{\mathbf{T}}, \mathbf{T} \in \mathcal{T}_h(\Omega)$  has to be provided either by means of an a priori analysis or by the numerical solution of the dual problem.

**Theorem.** Under the assumptions of the previous theorem let the error functional be given by

$$\mathbf{J}(\mathbf{v}) := \frac{(\nabla \mathbf{v}, \nabla \mathbf{e}_u)_{0,\Omega}}{\|\nabla \mathbf{e}_u\|_{0,\Omega}}, \quad \mathbf{v} \in \mathbf{V}.$$

Then, there holds

$$\|\nabla \mathbf{e}_u\|_{0,\Omega} \leq C \left( \sum_{\mathbf{T} \in \mathcal{T}_h(\Omega)} h_{\mathbf{T}}^2 \rho_{\mathbf{T}}^2 \right)^{1/2}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

**Proof.** The dual solution  $\mathbf{z} \in \mathbf{V}$  satisfies

$$a(\mathbf{v}, \mathbf{z}) = \frac{(\nabla \mathbf{v}, \nabla \mathbf{e}_u)_{0,\Omega}}{\|\nabla \mathbf{e}_u\|_{0,\Omega}}, \quad \mathbf{v} \in \mathbf{V},$$

from which we readily deduce the a priori bound

$$\|\nabla \mathbf{z}\|_{0,\Omega} \leq 1.$$

In view of the basic error estimate it follows that

$$J(\mathbf{e}_u) = \|\nabla \mathbf{e}_u\|_{0,\Omega} \leq \left( \sum_{T \in \mathcal{T}_h(\Omega)} h_T^2 \rho_T^2 \right)^{1/2} \left( \sum_{T \in \mathcal{T}_h(\Omega)} h_T^{-2} \omega_T^2 \right)^{1/2}.$$

Choosing  $\mathbf{v}_h = \mathbf{P}_C \mathbf{z}$ , where  $\mathbf{P}_C$  is Clément's quasi-interpolation operator, we find

$$\inf_{\mathbf{v}_h \in \mathbf{V}_h} \left( \sum_{T \in \mathcal{T}_h(\Omega)} (h_T^{-2} \|\mathbf{z} - \mathbf{v}_h\|_{0,T}^2 + h_T^{-1} \|\mathbf{z} - \mathbf{v}_h\|_{0,\partial T}^2) \right)^{1/2} \leq C \|\nabla \mathbf{z}\|_{0,\Omega}.$$

Using the last inequality in the previous one and observing the error representation gives the assertion.

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Goal-Oriented Dual Weighted Approach IV

**Theorem.** Consider the conforming P1 approximation of Poisson's equation under homogeneous Dirichlet boundary conditions and assume that the solution  $\mathbf{u} \in \mathbf{V} := \mathbf{H}_0^1(\Omega)$  is 2-regular. Using the the error functional

$$\mathbf{J}(\mathbf{v}) := \frac{(\mathbf{v}, \mathbf{e}_u)_{0,\Omega}}{\|\mathbf{e}_u\|_{0,\Omega}}, \quad \mathbf{v} \in \mathbf{V},$$

gives rise to the a posteriori error estimate

$$\|\mathbf{e}_u\|_{0,\Omega} \leq C \left( \sum_{T \in \mathcal{T}_h(\Omega)} h_T^4 \rho_T^2 \right)^{1/2}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Goal-Oriented Dual Weighted Approach V

Finally, we apply the goal-oriented dual weighted approach to the pointwise estimation of the error at some point  $\mathbf{a} \in \Omega$ . Given some tolerance  $\varepsilon > 0$ , we consider the ball

$$\mathbf{K}_\varepsilon(\mathbf{a}) := \{\mathbf{x} \in \Omega \mid |\mathbf{x} - \mathbf{a}| < \varepsilon\}$$

around the point  $\mathbf{a}$  and define the regularized error functional

$$\mathbf{J}(\mathbf{v}) := |\mathbf{K}_\varepsilon(\mathbf{a})|^{-1} \int_{\mathbf{K}_\varepsilon(\mathbf{a})} \mathbf{v} \, d\mathbf{x}.$$

The dual solution  $\mathbf{z}$  of  $\mathbf{a}(\mathbf{v}, \mathbf{z}) = \mathbf{J}(\mathbf{v})$  behaves like a regularized Green's function

$$\mathbf{z}(\mathbf{x}) \sim \log(\mathbf{r}(\mathbf{x})), \quad \mathbf{r}(\mathbf{x}) := \sqrt{|\mathbf{x} - \mathbf{a}|^2 + \varepsilon^2}.$$

With the residual  $\rho_{\mathbf{T}}$  we obtain

$$|(\mathbf{u} - \mathbf{u}_h)(\mathbf{a})| \sim \sum_{\mathbf{T} \in \mathcal{T}_h(\Omega)} \frac{h_{\mathbf{T}}^3}{r_{\mathbf{T}}^2} \rho_{\mathbf{T}}, \quad \mathbf{r}_{\mathbf{T}} := \max_{\mathbf{x} \in \mathbf{T}} \mathbf{r}(\mathbf{x}).$$

### Model Problem (Distributed Elliptic Control Problem with State Constraints)

Let  $\Omega \subset \mathbb{R}^2$  be a bounded domain with boundary  $\Gamma = \Gamma_D \cup \Gamma_N$ ,  $\Gamma_D \cap \Gamma_N = \emptyset$ , and let  $A : V \rightarrow H^{-1}(\Omega)$ ,  $V := \{v \in H^1(\Omega) \mid v|_{\Gamma_D} = 0\}$ , be the linear second order elliptic differential operator  $Ay := -\Delta y + cy$ ,  $c \geq 0$ , with  $c > 0$  or  $\text{meas}(\Gamma_D) > 0$ . Assume that  $\Omega$  is such that for each  $v \in L^2(\Omega)$  the solution  $y$  of  $Ay = u$  satisfies  $y \in W^{1,r}(\Omega) \cap V$  for some  $r > 2$ . Moreover, let  $u^d, y^d \in L^2(\Omega)$ , and  $\psi \in W^{1,r}(\Omega)$  such that  $\psi|_{\Gamma_D} > 0$  be given functions and let  $\alpha > 0$  be a regularization parameter.

Consider the state constrained distributed elliptic control problem

$$\text{Minimize} \quad J(y, u) := \frac{1}{2} \|y - y^d\|_{0,\Omega}^2 + \frac{\alpha}{2} \|u - u^d\|_{0,\Omega}^2,$$

$$\text{subject to} \quad Ay = u \text{ in } \Omega, \quad y = 0 \text{ on } \Gamma_D, \quad \nu \cdot \nabla y = 0 \text{ on } \Gamma_N,$$

$$Iy \in K := \{v \in C(\bar{\Omega}) \mid v(x) \leq \psi(x), x \in \bar{\Omega}\}.$$

where  $I$  stands for the embedding operator  $W^{1,r}(\Omega) \hookrightarrow C(\bar{\Omega})$ .

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## The Reduced Optimal Control Problem

We introduce the **control-to-state map**

$$G : L^2(\Omega) \rightarrow C(\bar{\Omega}) \quad , \quad y = Gu \text{ solves } Ay + cy = u .$$

We assume that the following **Slater condition** is satisfied

$$(S) \quad \text{There exists } v_0 \in L^2(\Omega) \text{ such that } Gv_0 \in \text{int}(K) .$$

Substituting  $y = Gu$  allows to consider the **reduced control problem**

$$\inf_{u \in U_{\text{ad}}} J_{\text{red}}(u) := \frac{1}{2} \|Gu - y^d\|_{0,\Omega}^2 + \frac{\alpha}{2} \|u - u^d\|_{0,\Omega}^2 ,$$

$$U_{\text{ad}} := \{v \in L^2(\Omega) \mid (Gv)(x) \leq \psi(x) , x \in \bar{\Omega}\} .$$

**Theorem (Existence and uniqueness).** The state constrained optimal control problem admits a unique solution  $y \in W^{1,r}(\Omega) \cap K$ .

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Optimality Conditions for the State Constrained Optimal Control Problem

**Theorem.** There exists an **adjoint state**  $\mathbf{p} \in \mathbf{V}^s := \{\mathbf{v} \in \mathbf{W}^{1,s}(\Omega) \mid \mathbf{v}_{\Gamma_D} = 0\}$ , where  $1/r + 1/s = 1$ , and a **multiplier**  $\boldsymbol{\sigma} \in \mathcal{M}_+(\Omega)$  such that

$$\begin{aligned}(\nabla \mathbf{y}, \nabla \mathbf{v})_{0,\Omega} + (\mathbf{c}\mathbf{y}, \mathbf{v})_{0,\Omega} &= (\mathbf{u}, \mathbf{v})_{0,\Omega} \quad , \quad \mathbf{v} \in \mathbf{V}^s , \\(\nabla \mathbf{p}, \nabla \mathbf{w})_{0,\Omega} + (\mathbf{c}\mathbf{p}, \mathbf{w})_{0,\Omega} &= (\mathbf{y} - \mathbf{y}^d, \mathbf{w})_{0,\Omega} + \langle \boldsymbol{\sigma}, \mathbf{w} \rangle \quad , \quad \mathbf{w} \in \mathbf{V}^r , \\ \mathbf{p} + \alpha(\mathbf{u} - \mathbf{u}^d) &= \mathbf{0} , \\ \langle \boldsymbol{\sigma}, \mathbf{y} - \boldsymbol{\psi} \rangle &= 0 .\end{aligned}$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

**Proof.** The reduced problem can be written in unconstrained form as

$$\inf_{\mathbf{v} \in L^2(\Omega)} \widehat{J}(\mathbf{v}) := J_{\text{red}}(\mathbf{v}) + (\mathbf{I}_K \circ G)(\mathbf{u})$$

where  $\mathbf{I}_K$  stands for the indicator function of the **constraint set K**. The **Slater condition** and **subdifferential calculus** tell us

$$\partial(\mathbf{I}_K \circ G)(\mathbf{u}) = G^* \circ \partial \mathbf{I}_K(G\mathbf{u}) .$$

The **optimality condition** then reads

$$0 \in \partial \widehat{J}(\mathbf{u}) = J'_{\text{red}}(\mathbf{u}) + G^* \circ \partial \mathbf{I}_K(G\mathbf{u}) .$$

Hence, there exists  $\boldsymbol{\sigma} \in \partial \mathbf{I}_K(G\mathbf{u})$  such that

$$\left( \underbrace{G^*(G\mathbf{u} - \mathbf{y}^d + \boldsymbol{\sigma})}_{=: \mathbf{p}} + \alpha(\mathbf{u} - \mathbf{u}^d), \mathbf{v} \right)_{0,\Omega} = 0 \quad , \quad \mathbf{v} \in L^2(\Omega) .$$

Since  $\boldsymbol{\sigma} \in \mathcal{M}(\Omega)$ , **PDE regularity theory** implies  $\mathbf{p} \in W^{1,s}(\Omega)$ ,  $1/s + 1/r = 1$ .

## Finite Element Approximation

Let  $\mathcal{T}_\ell(\Omega)$  be a **simplicial triangulation** of  $\Omega$  and let

$$V_\ell := \{ v_\ell \in C(\bar{\Omega}) \mid v_\ell|_T \in P_1(T), T \in \mathcal{T}_\ell(\Omega), v_\ell|_{\Gamma_D} = 0 \}$$

be the FE space of **continuous, piecewise linear functions**.

Let  $u_\ell^d \in V_\ell$  be some approximation of  $u^d$ , and let  $\psi_\ell$  be the  $V_\ell$ -interpoland of  $\psi$ .

Consider the following **FE Approximation** of the state constrained control problem

$$\begin{aligned} \text{Minimize} \quad & J_\ell(y_\ell, u_\ell) := \frac{1}{2} \|y_\ell - y^d\|_{0,\Omega}^2 + \frac{\alpha}{2} \|u_\ell - u_\ell^d\|_{0,\Omega}^2, \\ \text{over} \quad & (y_\ell, u_\ell) \in V_\ell \times V_\ell, \\ \text{subject to} \quad & (\nabla y_\ell, \nabla v_\ell)_{0,\Omega} + (c y_\ell, v_\ell)_{0,\Omega} = (u_\ell, v_\ell)_{0,\Omega}, v_\ell \in V_\ell, \\ & y_\ell \in K_\ell := \{v_\ell \in V_\ell \mid v_\ell(x) \leq \psi_\ell(x), x \in \bar{\Omega}\}. \end{aligned}$$

Since the constraints are point constraints associated with the nodal points, the **discrete multipliers** are chosen from

$$\mathcal{M}_\ell := \{ \mu_\ell \in \mathcal{M}(\Omega) \mid \mu_\ell = \sum_{a \in \mathcal{N}_\ell(\Omega \cup \Gamma_N)} \kappa_a \delta_a, \kappa_a \in \mathbb{R} \}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

Representation of the Error  
in the Quantity of Interest

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Primal-Dual Weighted Error Representation I

We set  $\mathbf{X} := \mathbf{V}^r \times \mathbf{L}^2(\Omega) \times \mathbf{V}^s$  as well as  $\mathbf{X}_\ell := \mathbf{V}_\ell \times \mathbf{V}_\ell \times \mathbf{V}_\ell$  and introduce the **Lagrangians**  $\mathcal{L} : \mathbf{X} \times \mathcal{M}(\Omega) \rightarrow \mathbb{R}$  as well as  $\mathcal{L}_\ell : \mathbf{X}_\ell \times \mathcal{M}_\ell \rightarrow \mathbb{R}$  according to

$$\mathcal{L}(\mathbf{x}, \boldsymbol{\sigma}) := \mathbf{J}(\mathbf{y}, \mathbf{u}) + (\nabla \mathbf{y}, \nabla \mathbf{p})_{0, \Omega} - (\mathbf{u}, \mathbf{p})_{0, \Omega} + \langle \boldsymbol{\sigma}, \mathbf{y} - \boldsymbol{\psi} \rangle ,$$

$$\mathcal{L}_\ell(\mathbf{x}_\ell, \boldsymbol{\sigma}_\ell) := \mathbf{J}_\ell(\mathbf{y}_\ell, \mathbf{u}_\ell) + (\nabla \mathbf{y}_\ell, \nabla \mathbf{p}_\ell)_{0, \Omega} - (\mathbf{u}_\ell, \mathbf{p}_\ell)_{0, \Omega} + \langle \boldsymbol{\sigma}_\ell, \mathbf{y}_\ell - \boldsymbol{\psi}_\ell \rangle ,$$

where  $\mathbf{x} := (\mathbf{y}, \mathbf{u}, \mathbf{p})$  and  $\mathbf{x}_\ell := (\mathbf{y}_\ell, \mathbf{u}_\ell, \mathbf{p}_\ell)$ .

Then, the **optimality conditions** can be stated as

$$\nabla_{\mathbf{x}} \mathcal{L}(\mathbf{x}, \boldsymbol{\sigma})(\boldsymbol{\varphi}) = \mathbf{0} \quad , \quad \boldsymbol{\varphi} \in \mathbf{X} ,$$

$$\nabla_{\mathbf{x}} \mathcal{L}_\ell(\mathbf{x}_\ell, \boldsymbol{\sigma}_\ell)(\boldsymbol{\varphi}_\ell) = \mathbf{0} \quad , \quad \boldsymbol{\varphi}_\ell \in \mathbf{X}_\ell .$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Primal-Dual Weighted Error Representation II

**Theorem.** Let  $(\mathbf{x}, \boldsymbol{\sigma}) \in \mathbf{X}$  and  $(\mathbf{x}_\ell, \boldsymbol{\sigma}_\ell) \in \mathbf{X}_\ell$  be the solutions of the continuous and discrete optimality systems, respectively. Then, there holds

$$\mathbf{J}(\mathbf{y}, \mathbf{u}) - \mathbf{J}_\ell(\mathbf{y}_\ell, \mathbf{u}_\ell) = -\frac{1}{2} \nabla_{\mathbf{xx}} \mathcal{L}(\mathbf{x}_\ell - \mathbf{x}, \mathbf{x}_\ell - \mathbf{x}) + \langle \boldsymbol{\sigma}, \mathbf{y}_\ell - \boldsymbol{\psi} \rangle + \text{osc}_\ell^{(1)},$$

where the data oscillations  $\text{osc}_\ell^{(1)}$  are given by

$$\text{osc}_\ell^{(1)} := \sum_{\mathbf{T} \in \mathcal{T}_\ell(\Omega)} \text{osc}_{\mathbf{T}}^{(1)},$$
$$\text{osc}_{\mathbf{T}}^{(1)} := (\mathbf{y}_\ell - \mathbf{y}_\ell^{\text{d}}, \mathbf{y}_\ell^{\text{d}} - \mathbf{y}^{\text{d}})_{0, \mathbf{T}} + \frac{1}{2} \|\mathbf{y}^{\text{d}} - \mathbf{y}_\ell^{\text{d}}\|_{0, \mathbf{T}}^2 + \alpha (\mathbf{u}_\ell - \mathbf{u}_\ell^{\text{d}}, \mathbf{u}_\ell^{\text{d}} - \mathbf{u}^{\text{d}})_{0, \mathbf{T}} + \frac{\alpha}{2} \|\mathbf{u}^{\text{d}} - \mathbf{u}_\ell^{\text{d}}\|_{0, \mathbf{T}}^2.$$

**Remark:** In the unconstrained case, i.e.,  $\boldsymbol{\sigma} = \boldsymbol{\sigma}_\ell = 0$ , the above result reduces to the error representation in [Becker, Kapp, and Rannacher (2000)].

## Interpolation Operators (State Constraints)

We introduce interpolation operators

$$i_\ell^y : V^{\bar{r}} \rightarrow V_\ell, \quad r > \bar{r} > 2, \quad i_\ell^p : V^{\bar{s}} \rightarrow V_\ell, \quad 0 < \bar{s} < s < 2,$$

such that for all  $y \in V^r$  and  $p \in V^s$  there holds

$$\begin{aligned} \left( h_T^{r(t-1)} \|i_\ell^y y - y\|_{t,r,T}^r \right)^{1/r} &\lesssim \|y\|_{1,r,D_T}, \quad 0 \leq t \leq 1, \\ \left( h_T^{-r} \|i_\ell^y y - y\|_{0,r,T}^r + h_T^{-r/2} \|i_\ell^y y - y\|_{0,r,\partial T}^r \right)^{1/r} &\lesssim \|y\|_{1,r,D_T}, \\ \left( h_T^{-s} \|i_\ell^p p - p\|_{0,s,T}^s + h_T^{-s/2} \|i_\ell^p p - p\|_{0,s,\partial T}^s \right)^{1/s} &\lesssim h_T \|p\|_{1,s,D_T}, \end{aligned}$$

where  $D_T := \{T' \in \mathcal{T}_\ell(\Omega) \mid \mathcal{N}_\ell(T') \cap \mathcal{N}_\ell(T) \neq \emptyset\}$ .

### Primal-Dual Weighted Error Representation III

**Theorem.** Under the assumptions of the previous Theorem let  $i_\ell^z, z \in \{y, p\}$ , be the interpolation operators introduced before. Then, there holds

$$J(y, u) - J_\ell(y_\ell, u_\ell) = -(r(i_\ell^y y - y) + r(i_\ell^p p - p)) + \mu_\ell(x, \sigma) + \text{osc}_\ell^{(1)} + \text{osc}_\ell^{(2)},$$

where  $r(i_\ell^y y - y)$  and  $r(i_\ell^p p - p)$  stand for the **primal-dual weighted residuals**

$$r(i_\ell^y y - y) := \frac{1}{2} ((y_\ell - y_\ell^d, i_\ell^y y - y)_{0,\Omega} + (\nabla(i_\ell^y y - y), \nabla p_\ell)_{0,\Omega} + \langle \sigma_\ell, i_\ell^y y - y \rangle),$$

$$r(i_\ell^p p - p) := \frac{1}{2} ((\nabla(i_\ell^p p - p), \nabla y_\ell)_{0,\Omega} - (u_\ell, i_\ell^p p - p)_{0,\Omega}).$$

Moreover,  $\mu_\ell(x, \sigma)$  represents the **primal-dual mismatch in complementarity**

$$\mu_\ell(x, \sigma) := \frac{1}{2} (\langle \sigma, y_\ell - \psi \rangle + \langle \sigma_\ell, \psi_\ell - y \rangle),$$

and  $\text{osc}_\ell^{(2)}$  are further **oscillation terms**

$$\text{osc}_\ell^{(2)} := \sum_{T \in \mathcal{T}_\ell(\Omega)} \text{osc}_T^{(2)}, \quad \text{osc}_T^{(2)} := \frac{1}{2} ((y^d - y_\ell^d, y_\ell - y)_{0,T} + \alpha (u^d - u_\ell^d, u_\ell - u)_{0,T}).$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Primal-Dual Weighted Residuals

### Primal-Dual Weighted Residuals

**Theorem.** The primal-dual residuals can be estimated according to

$$|r(i_\ell^y y - y)| \leq C \sum_{T \in \mathcal{T}_\ell(\Omega)} \left( \omega_T^y \rho_T^y + \omega_T^\sigma \rho_T^\sigma \right) , \quad |r(i_\ell^p p - p)| \leq C \sum_{T \in \mathcal{T}_\ell(\Omega)} \omega_T^p \rho_T^p .$$

Here,  $\rho_T^y$  and  $\rho_T^p$  are  $L^r$ -norms and  $L^s$ -norms of the **residuals** associated with the state and the adjoint state equation

$$\rho_T^y := \left( \|u_\ell\|_{0,r,T}^r + h_T^{-r/2} \left\| \frac{1}{2} \nu \cdot [\nabla y_\ell] \right\|_{0,r,\partial T}^r \right)^{1/r} ,$$

$$\rho_T^p := \left( \|y_\ell - y_\ell^d\|_{0,s,T}^s + h_T^{-s/2} \left\| \frac{1}{2} \nu \cdot [\nabla p_\ell] \right\|_{0,s,\partial T}^s \right)^{1/s} .$$

The corresponding **dual weights**  $\omega_T^y$  and  $\omega_T^p$  are given by

$$\omega_T^y := \left( \|i_\ell^p p - p\|_{0,s,T}^s + h_T^{s/2} \|i_\ell^p p - p\|_{0,s,\partial T}^s \right)^{1/s} ,$$

$$\omega_T^p := \left( \|i_\ell^y y - y\|_{0,r,T}^r + h_T^{r/2} \|i_\ell^y y - y\|_{0,r,\partial T}^r \right)^{1/r} .$$

The **residual**  $\rho_T^\sigma$  and its **dual weight**  $\omega_T^\sigma$  are given by

$$\rho_T^\sigma := n_a^{-1} \sum_{a \in \mathcal{N}_\ell(T)} \kappa_a , \quad \omega_T^\sigma := \|i_\ell^y y - y\|_{2/r+\varepsilon,r,T} , \quad 0 < \varepsilon < (r-2)/r .$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Primal-Dual Mismatch in Complementarity

## Primal-Dual Mismatch in Complementarity

The primal-dual mismatch  $\mu_\ell(\mathbf{x}, \boldsymbol{\sigma})$  can be made partially **a posteriori** in the following two particular cases (cf. [Bergounioux/Kunisch (2003)]):

### Regular Case

The active set  $\mathcal{A}$  is the union of a finite number of mutually disjoint, connected sets  $\mathcal{A}_i$ ,  $1 \leq i \leq m$ , with  $C^{1,1}$ -boundary.

$$p|_{\mathcal{I}} \in H^2(\mathcal{I}), \quad p|_{\text{int}(\mathcal{A})} \in H^2(\text{int}(\mathcal{A}))$$

$$-\Delta p = \mathbf{y}^d - \mathbf{y} \text{ in } \mathcal{I}, \quad p = -\alpha \Delta \psi \text{ in } \mathcal{A}$$

$$\boldsymbol{\sigma}_{\mathcal{A}} = \begin{cases} 0 & \text{on } \mathcal{I} \\ \mathbf{y}^d - \psi - \alpha \Delta^2 \psi & \text{on } \mathcal{A} \end{cases}$$

$$\boldsymbol{\sigma} = \boldsymbol{\sigma}_{\mathcal{A}} + \boldsymbol{\sigma}_{\mathcal{F}},$$

$$\boldsymbol{\sigma}_{\mathcal{F}} = -\frac{\partial p|_{\mathcal{I}}}{\partial \nu_{\mathcal{I}}} + \alpha \frac{\partial \Delta \psi}{\partial \nu_{\mathcal{A}}}$$

### Nonregular Case

The active set  $\mathcal{A}$  is a Lipschitzian curve that divides  $\Omega$  into two connected components  $\Omega_+$  and  $\Omega_-$ .

$$(\nabla p, \nabla \mathbf{w})_{0, \Omega} = (\mathbf{y}^d - \mathbf{y}, \mathbf{w}) - \langle \boldsymbol{\sigma}, \mathbf{w} \rangle, \quad \mathbf{w} \in \mathbf{V}^r$$

$$\boldsymbol{\sigma} = \boldsymbol{\sigma}_{\mathcal{A}} := \nu_{\mathcal{A}} \cdot \nabla p|_{\mathcal{A}_+} - \nu_{\mathcal{A}} \cdot \nabla p|_{\mathcal{A}_-}$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Primal-Dual Mismatch in Complementarity

The primal-dual mismatch in complementarity has the representations

$$\begin{aligned}\mu_\ell|_{\mathcal{I} \cap \mathcal{I}_\ell} &= \frac{1}{2} (\sigma_{\mathcal{F}}, y_\ell - \psi)_{0, \mathcal{F} \cap \mathcal{I}_\ell} + \frac{1}{2} \sum_{\mathbf{a} \in \mathcal{N}_\ell(\mathcal{F}_\ell \cap \mathcal{I})} \kappa_{\mathbf{a}} (y_\ell - \mathbf{y})(\mathbf{a}), \\ \mu_\ell|_{\mathcal{I} \cap \mathcal{A}_\ell} &= \frac{1}{2} (\sigma_{\mathcal{F}}, \psi_\ell - \psi)_{0, \mathcal{F} \cap \mathcal{A}_\ell} + \frac{1}{2} \sum_{\mathbf{a} \in \mathcal{N}_\ell(\mathcal{I} \cap \mathcal{A}_\ell)} \kappa_{\mathbf{a}} (\psi_\ell - \mathbf{y})(\mathbf{a}), \\ \mu_\ell|_{\mathcal{A} \cap \mathcal{I}_\ell} &= \frac{1}{2} (\sigma_{\mathcal{F}}, y_\ell - \psi)_{0, \mathcal{F} \cap \mathcal{I}_\ell} + \frac{1}{2} (y^{\text{d}} - \psi - \alpha \Delta^2 \psi, y_\ell - \psi)_{0, \mathcal{A} \cap \mathcal{I}_\ell}, \\ \mu_\ell|_{\mathcal{A} \cap \mathcal{A}_\ell} &= \frac{1}{2} (\sigma_{\mathcal{F}}, \psi_\ell - \psi)_{0, \mathcal{F} \cap \mathcal{A}_\ell} + \frac{1}{2} (y^{\text{d}} - \psi - \alpha \Delta^2 \psi, \psi_\ell - \psi)_{0, \mathcal{A} \cap \mathcal{A}_\ell}.\end{aligned}$$

Hence, we need appropriate approximations of the continuous coincidence set  $\mathcal{A}$ , the continuous non-coincidence set  $\mathcal{I}$ , the continuous free boundary  $\mathcal{F}$ , and of  $\sigma_{\mathcal{F}}$ .

## Primal-Dual Mismatch in Complementarity (State Constraints)

The coincidence set  $\mathcal{A}$  and the non-coincidence set  $\mathcal{I}$  will be approximated by

$$\begin{aligned}\hat{\mathcal{A}}_\ell &:= \bigcup \{T \in \mathcal{T}_\ell \mid \chi_\ell^A(\mathbf{x}) \geq 1 - \kappa h \text{ for all } \mathbf{x} \in T\}, \\ \hat{\mathcal{I}}_\ell &:= \bigcup \{T \in \mathcal{T}_\ell \mid \chi_\ell^A(\mathbf{x}) \leq 1 - \kappa h \text{ for some } \mathbf{x} \in T\},\end{aligned}$$

where

$$\chi_\ell^A := \mathbf{I} - \frac{\psi - \mathbf{i}_\ell^y y_\ell}{\gamma h^r + \psi - \mathbf{i}_\ell^y y_\ell}, \quad 0 < \gamma \leq 1, \quad r > 0.$$

Note that for  $T \subset \mathcal{A}$  we have

$$\|\chi(\mathcal{A}) - \chi_\ell^A\|_{0,T} \leq \min \left( |T|^{1/2}, \gamma^{-1} h^{-r} \|y - \mathbf{i}_\ell^y y\|_{0,T} \right) \rightarrow 0 \quad \text{for} \quad \|y - \mathbf{i}_\ell^y y\|_{0,T} = \mathcal{O}(h^q), \quad q > r.$$

Moreover,  $\sigma_{\mathcal{F}}$  will be approximated by

$$\sigma_{\hat{\mathcal{F}}_\ell} := \begin{cases} -\nu_{\hat{\mathcal{I}}_\ell} \cdot \nabla p_\ell|_{\hat{\mathcal{I}}_\ell} + \alpha \nu_{\hat{\mathcal{A}}_\ell} \cdot \nabla \Delta \psi & , \quad \mathbf{E} \in \partial \mathcal{T}_\ell(\hat{\mathcal{A}}) \cap \partial \mathcal{T}_\ell(\hat{\mathcal{I}}) \\ \nu_{\hat{\mathcal{A}}_\ell} \cdot \nabla p_\ell|_{\hat{\mathcal{A}}_{\ell,+}} - \nu_{\hat{\mathcal{A}}_\ell} \cdot \nabla p_\ell|_{\hat{\mathcal{A}}_{\ell,-}} & , \quad \mathbf{E} \in \mathcal{E}_\ell(\hat{\mathcal{A}}) \setminus (\partial \mathcal{T}_\ell(\hat{\mathcal{A}}) \cap \partial \mathcal{T}_\ell(\hat{\mathcal{I}})) \end{cases}.$$

## Primal-Dual Mismatch in Complementarity (State Constraints)

The primal-dual mismatch in complementarity can be estimated from above as follows:

$$|\mu_\ell|_{\mathcal{I} \cap \mathcal{I}_\ell} \leq \hat{\mu}_\ell^{(1)} + \hat{\mu}_\ell^{(2)}, \quad |\mu_\ell|_{\mathcal{I} \cap \mathcal{A}_\ell} \leq \hat{\mu}_\ell^{(1)} + \hat{\mu}_\ell^{(3)}, \quad |\mu_\ell|_{\mathcal{A} \cap \mathcal{I}_\ell} \leq \hat{\mu}_\ell^{(1)} + \hat{\mu}_\ell^{(4)}, \quad |\mu_\ell|_{\mathcal{A} \cap \mathcal{A}_\ell} \leq \hat{\mu}_\ell^{(1)} + \hat{\mu}_\ell^{(5)}.$$

where

$$\hat{\mu}_\ell^{(1)} := \sum_{\mathbf{E} \in \mathcal{E}_\ell(\hat{\mathcal{F}}_\ell)} \hat{\mu}_{\mathbf{E}}^{(1)}, \quad \hat{\mu}_{\mathbf{E}}^{(1)} := \frac{1}{2} \|\sigma_{\hat{\mathcal{F}}_\ell}\|_{0,\mathbf{E}} \|y_\ell - \psi\|_{0,\mathbf{E}},$$

$$\hat{\mu}_\ell^{(2)} := \sum_{\mathbf{E} \in \mathcal{E}_\ell(\mathcal{F}_\ell \cap \hat{\mathcal{I}}_\ell)} \hat{\mu}_{\mathbf{E}}^{(2)}, \quad \hat{\mu}_{\mathbf{E}}^{(2)} := \frac{1}{2} \sum_{\mathbf{a} \in \mathcal{N}_\ell(\mathbf{E})} |(y_\ell - \mathbf{i}_\ell^y y_\ell)(\mathbf{a})| \kappa_{\mathbf{a}},$$

$$\hat{\mu}_\ell^{(3)} := \sum_{\mathbf{T} \in \mathcal{T}_\ell(\hat{\mathcal{I}}_\ell \cap \mathcal{A}_\ell)} \hat{\mu}_{\mathbf{T}}^{(3)}, \quad \hat{\mu}_{\mathbf{T}}^{(3)} := \frac{1}{2} \sum_{\mathbf{a} \in \mathcal{N}_\ell(\mathbf{T})} |y_\ell - \mathbf{i}_\ell^y y_\ell)(\mathbf{a})| \kappa_{\mathbf{a}},$$

$$\hat{\mu}_\ell^{(4)} := \sum_{\mathbf{T} \in \mathcal{T}_\ell(\hat{\mathcal{A}}_\ell \cap \mathcal{I}_\ell)} \hat{\mu}_{\mathbf{T}}^{(4)}, \quad \hat{\mu}_{\mathbf{T}}^{(4)} := \frac{1}{2} \|y^d - \psi - \alpha \Delta^2 \psi\|_{0,\mathbf{T}} \|y_\ell - \psi\|_{0,\mathbf{T}},$$

$$\hat{\mu}_\ell^{(5)} := \sum_{\mathbf{T} \in \mathcal{T}_\ell(\hat{\mathcal{A}}_\ell \cap \mathcal{A}_\ell)} \hat{\mu}_{\mathbf{T}}^{(5)}, \quad \hat{\mu}_{\mathbf{T}}^{(5)} := \frac{1}{2} \|y^d - \psi - \alpha \Delta^2 \psi\|_{0,\mathbf{T}} \|\psi_\ell - \psi\|_{0,\mathbf{T}}.$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Primal-Dual Weighted Data Oscillations

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Primal-Dual Weighted Data Oscillations

The data oscillations  $\text{osc}_\ell^{(2)}$  as given by

$$\text{osc}_\ell^{(2)} := \sum_{T \in \mathcal{T}_\ell(\Omega)} \text{osc}_T^{(2)} \quad , \quad \text{osc}_T^{(2)} := \frac{1}{2} \left( (y^d - y_\ell^d, y_\ell - y)_{0,T} + \alpha (u^d - u_\ell^d, u_\ell - u)_{0,T} \right) ,$$

can be estimated from above according to

$$\text{osc}_\ell^{(2)} \preceq \sum_{T \in \mathcal{T}_\ell(\Omega)} \widehat{\text{osc}}_T^{(2)} \quad , \quad \widehat{\text{osc}}_T^{(2)} := \hat{\omega}_T^p \|u^d - u_\ell^d\|_{0,T} + \hat{\omega}_T^y \|y^d - y_\ell^d\|_{0,T} + \alpha \|u^d - u_\ell^d\|_{0,T}^2 ,$$

where the weights  $\hat{\omega}_T^p$  and  $\hat{\omega}_T^y$  are given by

$$\hat{\omega}_T^p := \|i_\ell^p p_\ell - p_\ell\|_{0,T} \quad , \quad \hat{\omega}_T^y := \|i_\ell^y y_\ell - y_\ell\|_{0,T} .$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## State Constraints: Numerical Results

## Numerical Results: Distributed Control Problem with State Constraints I

$$\begin{aligned} \text{Minimize} \quad & J(y, u) := \frac{1}{2} \|y - y^d\|_{0, \Omega}^2 + \frac{\alpha}{2} \|u - u^d\|_{0, \Omega}^2 \quad \text{over } (y, u) \in H_0^1(\Omega) \times L^2(\Omega) \\ \text{subject to} \quad & -\Delta y = u \quad \text{in } \Omega, \quad y \in K := \{v \in H_0^1(\Omega) \mid v \leq \psi \text{ a.e. in } \Omega\} \end{aligned}$$

$$\begin{aligned} \text{Data:} \quad & \Omega := (-2, +2)^2, \quad y^d(r) := y(r) + \Delta p(r) + \sigma(r), \quad u^d(r) := u(r) + \alpha^{-1} p(r), \\ & \psi := 0, \quad \alpha := 0.1, \end{aligned}$$

where  $y(r), u(r), p(r), \sigma(r)$  is the solution of the problem:

$$y(r) := -r^{4/3} + \gamma_1(r), \quad u(r) = -\Delta y(r), \quad p(r) = \gamma_2(r) + r^4 - \frac{3}{2}r^3 + \frac{9}{16}r^2, \quad \sigma(r) := \begin{cases} 0.0 & , \quad r < 0.75 \\ 0.1 & , \quad \text{otherwise} \end{cases}$$

$$, \quad \gamma_1 := \begin{cases} 1 & , \quad r < 0.25 \\ -192(r - 0.25)^5 + 240(r - 0.25)^4 - 80(r - 0.25)^3 + 1 & , \quad 0.25 < r < 0.75 \\ 0 & , \quad \text{otherwise} \end{cases}$$

$$\gamma_2 := \begin{cases} 1 & , \quad r < 0.75 \\ 0 & , \quad \text{otherwise} \end{cases} .$$

## Model Problem (Distributed Elliptic Control Problem with Control Constraints)

Given a bounded domain  $\Omega \subset \mathbb{R}^2$  with polygonal boundary  $\Gamma = \partial\Omega$ , a function  $y^d, \psi \in L^2(\Omega)$ , and  $\alpha > 0$ , consider the distributed optimal control problem

$$\begin{aligned} \text{Minimize} \quad & J(y, u) := \frac{1}{2} \|y - y^d\|_{0,\Omega}^2 + \frac{\alpha}{2} \|u\|_{0,\Omega}^2, \\ \text{over} \quad & (y, u) \in H_0^1(\Omega) \times L^2(\Omega), \\ \text{subject to} \quad & -\Delta y = u, \\ & u \in K := \{v \in L^2(\Omega) \mid v \leq \psi \text{ a.e. in } \Omega\}. \end{aligned}$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Optimality Conditions for the Distributed Control Problem

There exists an **adjoint state**  $\mathbf{p} \in \mathbf{H}_0^1(\Omega)$  and an **adjoint control**  $\boldsymbol{\sigma} \in \mathbf{L}^2(\Omega)$  such that the quadruple  $(\mathbf{y}, \mathbf{p}, \mathbf{u}, \boldsymbol{\sigma})$  satisfies

$$\begin{aligned} \mathbf{a}(\mathbf{y}, \mathbf{v}) &= (\mathbf{u}, \mathbf{v})_{0, \Omega} \quad , \quad \mathbf{v} \in \mathbf{H}_0^1(\Omega) \quad , \\ \mathbf{a}(\mathbf{p}, \mathbf{v}) &= (\mathbf{y}^d - \mathbf{y}, \mathbf{v})_{0, \Omega} \quad , \quad \mathbf{v} \in \mathbf{H}_0^1(\Omega) \quad , \\ \boldsymbol{\alpha} \mathbf{u} &= \mathbf{p} - \boldsymbol{\sigma} \quad , \\ \boldsymbol{\sigma} &\geq 0 \quad , \quad \mathbf{u} \leq \boldsymbol{\psi} \quad , \quad (\boldsymbol{\sigma}; \mathbf{u} - \boldsymbol{\psi})_{0, \Omega} = 0 \quad , \end{aligned}$$

where  $\mathbf{a}(\cdot, \cdot)$  stands for the bilinear form

$$\mathbf{a}(\mathbf{w}, \mathbf{z}) = \int_{\Omega} \nabla \mathbf{w} \cdot \nabla \mathbf{z} \, dx \quad , \quad \mathbf{w}, \mathbf{z} \in \mathbf{H}_0^1(\Omega) \quad .$$

## Finite Element Approximation of the Distributed Control Problem

Let  $\mathcal{T}_\ell(\Omega)$  be a **shape regular, simplicial triangulation** of  $\Omega$  and let

$$V_\ell := \{ v_\ell \in C(\Omega) \mid v_\ell|_T \in P_{k_1}(T), T \in \mathcal{T}_\ell(\Omega), k_1 \in \mathbb{N}, v_H|_{\partial\Omega} = 0 \}$$

be the FE space of **continuous, piecewise polynomial functions** (of degree  $k_1$ ) and

$$W_\ell := \{ w_\ell \in L^2(\Omega) \mid w_\ell|_T \in P_{k_2}(T), T \in \mathcal{T}_\ell(\Omega), k_2 \in \mathbb{N} \cup \{0\} \}$$

the linear space of **elementwise polynomial functions** (of degree  $k_2$ ).

Consider the following **FE Approximation** of the distributed control problem

$$\begin{aligned} \text{Minimize} \quad & J_\ell(y_\ell, u_\ell) := \frac{1}{2} \|y_\ell - y_\ell^d\|_{0,\Omega}^2 + \frac{\alpha}{2} \|u_\ell\|_{0,\Omega}^2, \\ \text{over} \quad & (y_\ell, u_\ell) \in V_\ell \times W_\ell, \\ \text{subject to} \quad & a(y_\ell, v_\ell) = (u_\ell, v_\ell)_{0,\Omega}, v_\ell \in V_\ell, \\ & u_\ell \in K_\ell := \{ w_\ell \in W_\ell \mid w_\ell|_T \leq \psi_\ell|_T, T \in \mathcal{T}_\ell(\Omega) \}. \end{aligned}$$

where  $\psi_\ell \in W_\ell$  is the discrete control constraint.

## Optimality Conditions for the FE Discretized Control Problem

There exists an **adjoint state**  $\mathbf{p}_\ell \in \mathbf{V}_\ell$  and an **adjoint control**  $\boldsymbol{\sigma}_\ell \in \mathbf{W}_\ell$  such that the quadruple  $(\mathbf{y}_\ell, \mathbf{u}_\ell, \mathbf{p}_\ell, \boldsymbol{\sigma}_\ell)$  satisfies

$$\begin{aligned} \mathbf{a}(\mathbf{y}_\ell, \mathbf{v}_\ell) &= (\mathbf{u}_\ell, \mathbf{v}_\ell)_{0, \Omega} \quad , \quad \mathbf{v}_\ell \in \mathbf{V}_\ell \quad , \\ \mathbf{a}(\mathbf{p}_\ell, \mathbf{v}_\ell) &= (\mathbf{y}_\ell^{\text{d}} - \mathbf{y}, \mathbf{v}_\ell)_{0, \Omega} \quad , \quad \mathbf{v}_\ell \in \mathbf{V}_\ell \quad , \\ \alpha \mathbf{u}_\ell &= \mathbf{M}_\ell \mathbf{p}_\ell - \boldsymbol{\sigma}_\ell \quad , \\ \boldsymbol{\sigma}_\ell &\geq 0 \quad , \quad \mathbf{u}_\ell \leq \boldsymbol{\psi}_\ell \quad , \quad (\boldsymbol{\sigma}_\ell, \mathbf{u}_\ell - \boldsymbol{\psi}_\ell)_{0, \Omega} = 0 \quad , \end{aligned}$$

where  $\mathbf{y}_\ell^{\text{d}} \in \mathbf{V}_\ell$  and  $\mathbf{M}_\ell : \mathbf{V}_\ell \rightarrow \mathbf{W}_\ell$ , e.g., for  $\mathbf{k}_2 = 0$ :

$$(\mathbf{M}_\ell \mathbf{v}_\ell)|_{\mathbf{T}} := |\mathbf{T}|^{-1} \int_{\mathbf{T}} \mathbf{v}_\ell \, \text{d}\mathbf{x} \quad , \quad \mathbf{T} \in \mathcal{T}_\ell(\Omega) \quad .$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Primal-Dual Weighted Error Representation (Control Constraints)

**Theorem.** Let  $(\mathbf{x}, \boldsymbol{\sigma}) \in \mathbf{X} \times \mathbf{L}^2(\Omega)$  and  $(\mathbf{x}_\ell, \boldsymbol{\sigma}_\ell) \in \mathbf{X}_\ell \times \mathbf{W}_\ell$  be the solutions of the continuous and discrete optimality systems, respectively. Then, there holds

$$\mathbf{J}(\mathbf{y}, \mathbf{u}) - \mathbf{J}_\ell(\mathbf{y}_\ell, \mathbf{u}_\ell) = -\frac{1}{2} \nabla_{\mathbf{xx}} \mathcal{L}(\mathbf{x}_\ell - \mathbf{x}, \mathbf{x}_\ell - \mathbf{x}) + (\boldsymbol{\sigma}, \mathbf{u}_\ell - \boldsymbol{\psi})_{0, \Omega} + \text{osc}_\ell^{(1)}.$$

**Remark:** In the unconstrained case, i.e.,  $\boldsymbol{\sigma} = \boldsymbol{\sigma}_\ell = 0$ , the above result reduces to the error representation in [Becker, Kapp, and Rannacher (2000)].

## Primal-Dual Weighted Error Representation (Control Constraints)

**Theorem.** Under the assumptions of the previous Theorem let  $i_\ell^z, z \in \{y, u, p\}$ , be the interpolation operators introduced before. Then, there holds

$$J(y, u) - J_\ell(y_\ell, u_\ell) = -\left(r(i_\ell^y y - y) + r(i_\ell^p p - p) + r(i_\ell^u u - u)\right) + \mu_\ell(x, \sigma) + \text{osc}_\ell^{(1)} + \text{osc}_\ell^{(2)},$$

where  $r(i_\ell^y y - y)$ ,  $r(i_\ell^p p - p)$  and  $r(i_\ell^u u - u)$  stand for the **primal-dual weighted residuals**

$$r(i_\ell^y y - y) := \frac{1}{2} \left( (y_\ell - y_\ell^d, i_\ell^y y - y)_{0,\Omega} + (\nabla(i_\ell^y y - y), \nabla p_\ell)_{0,\Omega} \right),$$

$$r(i_\ell^p p - p) := \frac{1}{2} \left( (\nabla(i_\ell^p p - p), \nabla y_\ell)_{0,\Omega} - (u_\ell, i_\ell^p p - p)_{0,\Omega} \right), \quad r(i_\ell^u u - u) := \frac{1}{2} (M_\ell p_\ell - p_\ell, i_\ell^u u - u)_{0,\Omega}.$$

Moreover,  $\mu_\ell(x, \sigma)$  represents the **primal-dual mismatch in complementarity**

$$\mu_\ell(x, \sigma) := \frac{1}{2} \left( (\sigma, u_\ell - \psi)_{0,\Omega} + (\sigma_\ell, \psi_\ell - u)_{0,\Omega} \right),$$

and  $\text{osc}_\ell^{(2)}$  is a further **oscillation term**

$$\text{osc}_\ell^{(2)} := \sum_{T \in \mathcal{T}_\ell(\Omega)} \text{osc}_T^{(2)}, \quad \text{osc}_T^{(2)} := \frac{1}{2} (y^d - y_\ell^d, y_\ell - y)_{0,T}.$$

## Primal-Dual Weighted Residuals (Control Constraints)

**Theorem.** The primal-dual residuals can be estimated according to

$$|r(i_\ell^y y - y)| \leq C \sum_{T \in \mathcal{T}_\ell(\Omega)} \omega_T^y \rho_T^y, \quad |r(i_\ell^p p - p)| \leq C \sum_{T \in \mathcal{T}_\ell(\Omega)} \left( \omega_T^p \rho_T^{p,1} + \omega_T^u \rho_T^{p,2} \right).$$

Here,  $\rho_T^y$  and  $\rho_T^{p,1}$  are  $L^2$ -norms of the **residuals** associated with the state and the adjoint state

$$\rho_T^y := \left( \|u_\ell\|_{0,T}^2 + h_T^{-1} \left\| \frac{1}{2} \nu \cdot [\nabla y_\ell] \right\|_{0,\partial T}^2 \right)^{1/2},$$

$$\rho_T^{p,1} := \left( \|y_\ell - y_\ell^d\|_{0,T}^2 + h_T^{-1} \left\| \frac{1}{2} \nu \cdot [\nabla p_\ell] \right\|_{0,\partial T}^2 \right)^{1/2}.$$

The corresponding **dual weights**  $\omega_T^u$  and  $\omega_T^p$  are given by

$$\omega_T^y := \left( \|i_\ell^p p - p\|_{0,T}^2 + h_T \|i_\ell^p p - p\|_{0,\partial T}^2 \right)^{1/2},$$

$$\omega_T^p := \left( \|i_\ell^y y - y\|_{0,T}^2 + h_T \|i_\ell^y y - y\|_{0,\partial T}^2 \right)^{1/2}.$$

The **residual**  $\rho_T^{p,2}$  and its **dual weight**  $\omega_T^u$  are given by

$$\rho_T^{p,2} := \|M_\ell p_\ell - p_\ell\|_{0,T}, \quad \omega_T^u := \|i_\ell^u u - u\|_{0,T}.$$

## Primal-Dual Mismatch in Complementarity (Control Constraints)

Using the complementarity conditions

$$\begin{aligned} \mathbf{u} \leq \boldsymbol{\psi} \quad , \quad \boldsymbol{\sigma} \geq \mathbf{0} \quad , \quad (\boldsymbol{\sigma}, \mathbf{u} - \boldsymbol{\psi})_{0, \Omega} = 0 \quad , \quad \alpha \mathbf{u} - \mathbf{p} + \boldsymbol{\sigma} = \mathbf{0} \quad , \\ \mathbf{u}_\ell \leq \boldsymbol{\psi}_\ell \quad , \quad \boldsymbol{\sigma}_\ell \geq \mathbf{0} \quad , \quad (\boldsymbol{\sigma}_\ell, \mathbf{u}_\ell - \boldsymbol{\psi}_\ell)_{0, \Omega} = 0 \quad , \quad \alpha \mathbf{u}_\ell - \mathbf{M}_\ell \mathbf{p}_\ell + \boldsymbol{\sigma}_\ell = \mathbf{0} \quad , \end{aligned}$$

the primal-dual mismatch  $\mu_\ell := \mu_\ell(\mathbf{x}, \boldsymbol{\sigma})$  can be further assessed according to

$$\begin{aligned} \mu_\ell(\mathcal{I} \cap \mathcal{I}_\ell) &= 0 \quad , \\ \mu_\ell(\mathcal{A} \cap \mathcal{A}_\ell) &= \frac{1}{2} (\boldsymbol{\sigma} + \boldsymbol{\sigma}_\ell, \boldsymbol{\psi}_\ell - \boldsymbol{\psi})_{0, \mathcal{A} \cap \mathcal{A}_\ell} \quad , \\ \mu_\ell(\mathcal{I} \cap \mathcal{A}_\ell) &= \frac{1}{2} (\boldsymbol{\sigma}_\ell, \boldsymbol{\psi}_\ell - \alpha^{-1} \mathbf{p})_{0, \mathcal{I} \cap \mathcal{A}_\ell} \quad , \\ \mu_\ell(\mathcal{A} \cap \mathcal{I}_\ell) &= \frac{\alpha}{2} \|\mathbf{u} - \mathbf{u}_\ell\|_{0, \mathcal{I} \cap \mathcal{A}_\ell}^2 + \frac{1}{2} (\mathbf{p} - \mathbf{M}_\ell \mathbf{p}_\ell, \mathbf{u}_\ell - \mathbf{u})_{0, \mathcal{I} \cap \mathcal{A}_\ell} \quad . \end{aligned}$$

and we finally obtain

$$|\mu_\ell(\mathcal{I} \cap \mathcal{A}_\ell) + \mu_\ell(\mathcal{A} \cap \mathcal{I}_\ell)| \leq \nu_\ell$$

with a fully computable a posteriori term  $\nu_\ell$  (consistency error).

**Elliptic Optimal Control Problems**  
**Constraints on the Gradient of the State**

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Elliptic Optimal Control with Pointwise Gradient-State Constraints

Let  $\Omega \subset \mathbb{R}^2$  be a bounded polygonal domain with boundary  $\Gamma$ ,  $y^d \in L^2(\Omega)$  a desired state,  $f$  a forcing term,  $\psi \in L^2(\Omega)$  s.th.  $\psi \geq \psi_{\min} > 0$  a.e. in  $\Omega$ , and  $\alpha > 0$ , find  $(y, u) \in H_0^1(\Omega) \times L^2(\Omega)$  such that

$$(P) \quad \inf_{(y, u)} J(y, u) := \frac{1}{2} \int_{\Omega} |y - y^d|^2 \, dx + \frac{\alpha}{2} \int_{\Omega} |u|^2 \, dx,$$

subject to

$$\begin{aligned} Ly &:= -\nabla \cdot a \nabla y + cy = f + u \quad \text{in } \Omega, \\ y &= 0 \quad \text{on } \Gamma, \\ \nabla y &\in K := \{v \in L^2(\Omega)^2 \mid |v| \leq \psi \text{ a.e. in } \Omega\}. \end{aligned}$$

Department of Mathematics, University of Houston  
Institut für Mathematik, Universität Augsburg

## Pointwise Gradient-State Constraints: State-Reduced Formulation

Let  $\hat{V} \subset H_0^1(\Omega)$  be a reflexive Banach space and let  $\hat{G} : L^2(\Omega) \rightarrow \hat{V}$  be the map that assigns to the rhs  $f + u$  the solution  $y = \hat{G}(f + u)$  of the state equation. Assume that  $\hat{G}$  is a bounded linear operator which is invertible such that  $u = \hat{G}^{-1}y - f$ .

This leads to the state-reduced formulation:

Find  $y \in \hat{K} := \{v \in \hat{V} \mid |\nabla v| \leq \psi \text{ bf a.e. in } \Omega\}$  such that

$$\inf_{y \in \hat{K}} J_{\text{red}}(y) := \frac{1}{2} \int_{\Omega} |y - y^d|^2 \, dx + \frac{\alpha}{2} \int_{\Omega} |\hat{G}^{-1}y - f|^2 \, dx.$$

Unconstrained formulation:

$$\inf_{y \in \hat{V}} J_{\text{red}}(y) + I_{\hat{K}}(y)$$

where  $I_{\hat{K}}$  stands for the indicator function of the set  $\hat{K}$ .

## State-Reduced Formulation: Optimality Conditions

**Theorem.** The gradient-state constrained optimal control problem admits a unique solution  $(y, u) \in \hat{K} \times L^2(\Omega)$  which is characterized by the existence of a unique pair  $(p, w) \in L^2(\Omega) \times \hat{V}^*$  satisfying

$$\begin{aligned} Lp &= -\nabla \cdot (a\nabla p) + cp = y^d - y - w \quad \text{in } \hat{V}^*, \\ p &= \alpha u \quad \text{in } L^2(\Omega), \\ w &\in N_{\hat{K}}(y) := \{\xi \in \hat{V}^* \mid \langle \xi, z - y \rangle_{\hat{V}^*, \hat{V}} \leq 0, z \in \hat{K}\}. \end{aligned}$$

**Remark.** If  $\hat{V} = W^{2,r}(\Omega) \cap H_0^1(\Omega)$ ,  $r > 2$ , there exists a **Slater point**, i.e.,  $y_0 \in \text{int } \hat{K}$  and  $|\nabla(y_0 + v)| \leq \psi$  in  $\Omega$  for all  $v \in C^1(\bar{\Omega})$  s.th.  $\|v\|_{C^1(\bar{\Omega})} \leq \delta$  for sufficiently small  $\delta > 0$ .

$$0 \in J'_{\text{red}}(y) + \partial(I_{\hat{K}} \circ \nabla)(y) = J'_{\text{red}}(y) - \nabla \cdot \partial I_{\hat{K}}(\nabla y),$$

i.e., there exists  $\mu \in \partial I_{\hat{K}}(\nabla y) \subset M(\bar{\Omega})^2$  such that  $w = -\nabla \cdot \mu$ .

## Control-Reduced Formulation and Dual Problem

Denoting by  $G : H^{-1}(\Omega) \rightarrow H_0^1(\Omega)$  the solution operator associated with the state equation, the optimal control problem can be written according to

$$\inf_{u \in L^2(\Omega)} \mathcal{F}(u) + \mathcal{G}(\Lambda u)$$

where

$$\mathcal{F}(u) := J(G(f + u), u), \quad \mathcal{G}(q) := I_K(q), \quad \Lambda := \nabla G.$$

Denoting by  $\mathcal{F}^*$  and  $\mathcal{G}^*$  the **Fenchel conjugates** of  $\mathcal{F}$  and  $\mathcal{G}$

$$\mathcal{F}^*(u^*) = \frac{1}{2} \|u^* + G^* y^d + \alpha f\|_{M^{-1}}^2, \quad \mathcal{G}^*(q^*) = \int_{\Omega} \psi |q^*| dx,$$

where  $M := G^*G + \alpha I$  and  $\|\cdot\|_{M^{-1}}^2 := (M^{-1}\cdot, \cdot)_{0,\Omega}$ , the **dual problem** reads as follows:

$$(D) \quad \sup_{q^* \in L^2(\Omega)} -\mathcal{F}^*(\Lambda^* q^*) - \mathcal{G}^*(-q^*) \iff \inf_{\mu \in L^2(\Omega)} \frac{1}{2} \|G^*(\nabla^* \mu + y^d) + \alpha f\|_{M^{-1}}^2 + \int_{\Omega} \psi |\mu| dx.$$

## Tightened Formulation of the Primal Problem

Consider the following tightened formulation of the primal problem

$$(\hat{\mathbf{P}}) \quad \inf_{(y, u) \in \hat{\mathbf{V}} \times L^2(\Omega)} \mathbf{J}(y, u) := \frac{1}{2} \int_{\Omega} |y - y^d|^2 dx + \frac{\alpha}{2} \int_{\Omega} |u|^2 dx,$$

subject to

$$\mathbf{L}y = \mathbf{f} + u \quad \text{in } \Omega, \quad y = 0 \quad \text{on } \Gamma, \quad |\nabla y| \leq \psi \quad \text{a.e. in } \Omega.$$

**Theorem.** Let  $\{\mu_n\}_{\mathbb{N}} \subset L^2(\Omega)^2$  be a minimizing sequence for the dual  $(\hat{\mathbf{D}})$  to  $(\hat{\mathbf{P}})$ .

Then, there exist a subsequence  $\{\mu_n\}_{\mathbb{N}}$  and  $\mu \in M(\bar{\Omega})^2$  such that

$$\mathbf{w}^* - \lim \mu_n = \mu \quad \text{in } M(\bar{\Omega})^2 \quad \text{and} \quad \mathbf{w} - \lim \nabla \cdot \mu_n = -\mathbf{w} \quad \text{in } \hat{\mathbf{V}}^*.$$

Moreover, the limit  $\mathbf{w} \in \hat{\mathbf{V}}^*$  satisfies

$$(*) \quad \mathbf{L}y = \mathbf{f} + u \quad \text{in } L^2(\Omega), \quad \mathbf{L}p = y^d - y - \mathbf{w} \quad \text{in } \hat{\mathbf{V}}^*, \quad p = \alpha u \quad \text{in } L^2(\Omega).$$

**Remark.** A quadruple  $(y, u, p, \mathbf{w}) \in V \times L^2(\Omega) \times L^2(\Omega) \times \hat{\mathbf{V}}^*$  such that  $(*)$  holds true and  $\nabla y \in (M(\bar{\Omega})^2)^* \setminus C(\bar{\Omega})^2$ , is called a **weak solution** of  $(\mathbf{P})$ .

## Finite Element Discretization of $(P)$ and $(\hat{P})$

Let  $\mathcal{T}_h(\Omega)$  be a simplicial triangulation of  $\Omega$  and denote by  $\mathcal{E}_h(D)$  the set of edges of  $\mathcal{T}_h(\Omega)$  in  $D \subset \Omega$ . We refer to  $V_h := \{v_h \in C_0(\Omega) \mid v_h|_T \in P_1(T), T \in \mathcal{T}_h(\Omega)\}$  as the finite element space of P1 conforming FEs w.r.t.  $\mathcal{T}_h(\Omega)$  and set  $W_h := \{w_h : \bar{\Omega} \rightarrow \mathbb{R}^2 \mid w_h|_T \in P_0(T)^2, T \in \mathcal{T}_h(\Omega)\}$ . We define  $\psi_h$  according to  $\psi_h|_T := |T|^{-1} \int_T \psi dx, T \in \mathcal{T}_h(\Omega)$  and set  $K_h := \{z_h \in W_h \mid |z_h|_T| \leq \psi_h|_T, T \in \mathcal{T}_h(\Omega)\}$ .

The discrete optimal control problems reads:

$$(\hat{P}_h) \quad \inf_{(y_h, u_h)} J(y_h, u_h) := \frac{1}{2} \int_{\Omega} |y_h - y^d|^2 dx + \frac{\alpha}{2} \int_{\Omega} |u_h|^2 dx,$$

$$\text{subject to } a(y_h, v_h) = (f + u_h, v_h)_{0,\Omega}, \quad v_h \in V_h, \\ \nabla y_h \in K_h.$$

## Discrete Optimal Control Problem: Optimality Conditions

**Theorem.** The discrete optimal control problem  $(\hat{P}_h)$  admits a unique solution  $(y_h, u_h) \in V_h \times V_h$  which is characterized by the existence of an adjoint state  $p_h \in V_h$  and a multiplier  $\mu_h \in W_h$  such that

$$a(p_h, v_h) - (y^d - y_h, v_h)_{0,\Omega} + \sum_{T \in \mathcal{T}_h(\Omega)} (\mu_h|_T, \nabla v_h|_T)_{0,T} = 0, \quad v_h \in V_h,$$

$$p_h - \alpha u_h = 0,$$

$$\sum_{T \in \mathcal{T}_h(\Omega)} (\mu_h|_T, q_h|_T - \nabla y_h|_T)_{0,T} \leq 0, \quad q_h \in K_h.$$

**Remark.** The **Fenchel dual** associated with  $(\hat{P}_h)$  reads

$$(\hat{D}_h) \quad \inf_{\mu_h \in W_h} \frac{1}{2} \|G_h^*(\nabla^* \mu_h + y^d) + \alpha f\|_{M_h^{-1}}^2 + \int_{\Omega} \psi_h |\mu_h| dx.$$

**Prager-Synge Equilibration** (cf. Braess/Schöberl (08), Braess/H./Schöberl (09))

Construct  $\tilde{\mu}_h \in \mathbf{RT}_0(\Omega; \mathcal{T}_h(\Omega))$  such that

$$\begin{aligned} \sum_{T \in \mathcal{T}_h(\Omega)} (\mu_h|_T, \nabla v_h|_T)_{0,T} &= \sum_{E \in \mathcal{E}_h(\Omega)} (\mathbf{n}_E \cdot [\mu_h]_E, v_h)_{0,E} \\ &= - \sum_{T \in \mathcal{T}_h(\Omega)} (\nabla \cdot \tilde{\mu}_h, v_h)_{0,T}, \quad v_h \in V_h. \end{aligned}$$

Then the **discrete optimality system** can be written according to

$$\begin{aligned} \mathbf{a}(p_h, v_h) - (y^d - y_h, v_h)_{0,\Omega} - \sum_{T \in \mathcal{T}_h(\Omega)} (\nabla \cdot \tilde{\mu}_h, \nabla v_h)_{0,T} &= 0, \quad v_h \in V_h, \\ p_h - \alpha u_h &= 0, \\ \sum_{T \in \mathcal{T}_h(\Omega)} (\mu_h|_T, q_h|_T - \nabla y_h|_T)_{0,T} &\leq 0, \quad q_h \in K_h. \end{aligned}$$

## Residual-Type A Posteriori Error Estimator

We choose  $\hat{V} = W_0^{1,r}(\Omega)$ ,  $r > 2$ , such that  $\hat{V}^* = W^{-1,s}(\Omega)$ ,  $1/r + 1/s = 1$ .

The associated residual-type a posteriori error estimator reads

$$\eta_h := \left( \sum_{T \in \mathcal{T}_h(\Omega)} \eta_{y,T}^r \right)^{1/r} + \left( \sum_{E \in \mathcal{E}_h(\Omega)} \eta_{y,E}^r \right)^{1/r} + \left( \sum_{T \in \mathcal{T}_h(\Omega)} \eta_{p,T}^s \right)^{1/s} + \left( \sum_{E \in \mathcal{E}_h(\Omega)} \eta_{p,E}^s \right)^{1/s},$$

where the element residuals  $\eta_{y,T}, \eta_{p,T}$  and the edge residuals  $\eta_{y,E}, \eta_{p,E}$  are given by

$$\eta_{y,T}^r := h_T^r \| \mathbf{f} + \mathbf{u}_h + \nabla \cdot (\mathbf{a} \nabla y_h) - \mathbf{c} y_h \|_{0,T}^r,$$

$$\eta_{p,T}^s := h_T^s \| \mathbf{y}^d - y_h + \nabla \cdot (\mathbf{a} \nabla p_h) - \mathbf{c} p_h + \nabla \cdot \tilde{\boldsymbol{\mu}}_h \|_{0,T}^s,$$

$$\eta_{y,E}^r := h_E^{r/2} \| \mathbf{n}_E \cdot [\mathbf{a} \nabla y_h]_E \|_{0,E}^r, \quad \eta_{p,E}^s := h_E^{s/2} \| \mathbf{n}_E \cdot [\mathbf{a} \nabla p_h]_E \|_{0,E}^s.$$

Department of Mathematics, University of Houston

## Reliability of the A Posteriori Error Estimator

**Theorem.** Let  $(y, u, p, w) \in W_0^{1,r} \times L^2(\Omega) \times W_0^{1,s}(\Omega) \times W^{-1,s}(\Omega)$  and  $(y_h, u_h, p_h, w_h) \in V_h \times V_h \times V_h \times W_h$  be the solution of  $(\hat{P})$  and  $(\hat{P}_h)$ , respectively. Let further  $\eta$  be the residual error estimator. Then, there holds

$$\|y - y_h\|_{W_0^{1,r}}^2 + \|u - u_h\|_{0,\Omega}^2 \lesssim \eta^2 + |\langle w, y - y_h \rangle_{W^{-1,s}(\Omega), W_0^{1,r}(\Omega)}|.$$

## Gradient-State Constraints: Numerical Examples

We choose  $\Omega := \{(r, \varphi) \mid r \in (0, 1), \varphi \in (0, \omega)\}$  with boundaries  $\Gamma_1 := [0, 1] \times \{0\} \cup \{(r \cos \omega, r \sin \omega) \mid r \in [0, 1]\}$  and  $\Gamma_2 := \{(\cos \varphi, \sin \varphi) \mid \varphi \in (0, \omega)\}$ . We further choose  $y^d := r^{\pi/\omega} \sin(\pi\varphi/\omega)$ ,  $\psi \in L^q(\Omega)$  for some  $q > 2$  and  $\alpha = 1$  as well as  $a = 1, c = 0$  and  $f = 0$ .

**Remark.** The state satisfies  $y \in W^{1,r}(\Omega)$  with  $r := \frac{2\omega}{\omega - \pi}$ .

**Ex. 1:**  $\omega = \frac{5}{4}\pi$ ,  $r = 10$ ,  $\psi(x) := 2|x|^{-1/5} + |x| - 1.9$  ( $\psi \in L^{10}(\Omega)$ ).

**Ex. 2:**  $\omega = \frac{3}{2}\pi$ ,  $r = 6$ ,  $\psi(x) := 0.1|x|^{-1/3} + 0.9$  ( $\psi \in L^6(\Omega)$ ).
