Spectral disjointness of powers of diffeomorphisms with arbitrary Liouvillean rotation behavior

PHILIPP KUNDE

August 8, 2017

Abstract

We show that on any smooth compact connected manifold of dimension $m \geq 2$ admitting a smooth non-trivial circle action preserving a smooth volume $\nu$ the set of $(\kappa_1, \ldots, \kappa_k)$-weakly mixing $C^\infty$-diffeomorphisms is generic in $A_\alpha(M) = \{h \circ S_\alpha \circ h^{-1} : h \in \text{Diff}^\infty(M, \nu)\}$ for every Liouvillean number $\alpha$, $k \in \mathbb{N}$ and specific tuples $(\kappa_1, \ldots, \kappa_k) \in [0, 1]^k$. In particular, these diffeomorphisms have spectrally disjoint powers. The proof is based on a quantitative version of the Approximation by Conjugation-method with explicitly defined conjugation maps and partitions.

1 Introduction

For a start, we recall that a dynamical system $(X, T, \nu)$ on a probability space $(X, \nu)$ is said to be weakly mixing if there is no nonconstant function $h \in L^2(X, \nu)$ such that $h(Tx) = \lambda \cdot h(x)$ for some $\lambda \in \mathbb{C}$. Equivalently there is an increasing sequence $(m_n)_{n \in \mathbb{N}}$ of natural numbers such that the weak convergence $U_T \rightarrow_w (\kappa \cdot P_c + (1 - \kappa) \cdot Id)$ holds, where $U_T : L^2(X, \mu) \rightarrow L^2(X, \mu)$, $f \mapsto f \circ T$, is the Koopman-operator induced by $T$ and $P_c$ is the projection on the subspace of constants.

Definition 1.1. An automorphism $T$ of a Lebesgue probability space $(X, \mu)$ is said to be $\kappa$-weakly mixing, $\kappa \in [0, 1]$, if there exists a strictly increasing sequence $(m_n)_{n \in \mathbb{N}}$ of natural numbers such that the weak convergence

$$U_T^{m_n} \rightarrow_w (\kappa \cdot P_c + (1 - \kappa) \cdot Id)$$

holds, where $U_T : L^2(X, \mu) \rightarrow L^2(X, \mu)$, $f \mapsto f \circ T$, is the Koopman-operator induced by $T$ and $P_c$ is the projection on the subspace of constants.

By [St87, Proposition 3.1.] we can characterize this property in geometric language: A transformation $T$ is $\kappa$-weakly mixing if and only if there is an increasing sequence $(m_n)_{n \in \mathbb{N}}$ of natural numbers such that for all measurable sets $A$ and $B$

$$\lim_{n \rightarrow \infty} \mu (A \cap T^{m_n}B) = \kappa \cdot \mu (A) \cdot \mu (B) + (1 - \kappa) \cdot \mu (A \cap B)$$

We recognize that 0-weakly mixing corresponds to rigidity and 1-weakly mixing to the usual notion of weak mixing. So $\kappa$-weakly mixing interpolates between the notions of recurrence and weak
mixing. In fact for $\kappa > 0$ a $\kappa$-weakly mixing transformation has a continuous spectrum due to [St87, Proposition 3.4]. Thus it is weakly mixing.

The concept of $\kappa$-weakly mixing has implications on the spectral properties of the transformation (see [St87, Theorem 1]): If $\kappa \in (0,1)$ and $T$ is a $\kappa$-weakly mixing transformation, then a measure $\sigma_0$ of maximal spectral type of the operator $U_T$ on the orthogonal complement $H_0 \subset L^2(X,\mu)$ to the subspace of constants satisfies that it and its convolutions $\sigma_0^k$ are pairwise mutually singular. This property is called disjointness of convolutions. It is linked to a conjecture of Kolmogorov respectively Rokhlin and Fomin (after verifying that the property held for all dynamical systems known at that time, especially large classes of systems of probabilistic origin like Gaussian ones), namely that every ergodic transformation possesses the so-called group property, i.e. the maximal spectral type $\sigma$ is symmetric and dominates its square $\sigma \ast \sigma$. This conjecture is an analogue of the well-known group property of the set of eigenvalues of an ergodic automorphism and was proven to be false. Indeed, in [St66] Stepin gave the first example of a dynamical system without the group property. V.I. Oseledets constructed an analogous example with continuous spectrum ([Os69]).

Later Stepin showed that for a generic transformation all convolutions $\sigma^k$, $k \in \mathbb{N}$, of the maximal spectral type $\sigma$ on $L^2_0(X,\mu)$ are mutually singular (see [St87]) exploiting the concept of $\kappa$-weak mixing.

In [JL92] del Junco and Lemanczyk introduced the following strengthening of the notion of $\kappa$-weak mixing:

**Definition 1.2.** Let $T$ be an automorphism of a Lebesgue probability space $(X,\mathcal{B},\mu)$ and $\kappa_1,\ldots,\kappa_k \in [0,1]$. Then $T$ is called $(\kappa_1,\ldots,\kappa_k)$-weakly mixing, if there is an increasing sequence $(m_n)_{n \in \mathbb{N}}$ of natural numbers such that for each $i = 1,\ldots,k$ and for all $A,B \in \mathcal{B}$

$$\lim_{n \to \infty} \mu \left( A \cap T^{-m_n} B \right) = \kappa_i \cdot \mu(A) \cdot \mu(B) + (1-\kappa_i) \cdot \mu(A \cap B).$$

In other words, each $T^i$ is $\kappa_i$-weakly mixing along the common sequence $(m_n)_{n \in \mathbb{N}}$. With the aid of this concept del Junco and Lemanczyk were able to prove that for a generic automorphism for each $k(1),\ldots,k(l) \in \mathbb{N}$, $k'(1),\ldots,k'((l')) \in \mathbb{N}$ the convolutions $\sigma_{T^{k(1)}} \ast \cdots \ast \sigma_{T^{k(l)}}$ and $\sigma_{T^{k'(1)}} \ast \cdots \ast \sigma_{T^{k'(l')}}$ are mutually singular unless $(k(1),\ldots,k(l))$ is a permutation of $(k'(1),\ldots,k'(l'))$ ([JL92 Theorem 1]). Hereby, they were also able to get a description of the centralizer of $T^{k_1} \times T^{k_2} \times \ldots$ as well as to reproduce several counterexamples (like non-disjoint transformations that have no common factor or automorphisms with no roots) of Rudolph ([Ru79, section 4]) in a broader context.

An important question in Ergodic Theory (e.g. [OW91, p.89]) that dates back to the foundational paper [Ne32] of von Neumann asks

**Question.** Are there smooth versions to the objects and concepts of abstract ergodic theory?

By a smooth version we mean a smooth diffeomorphism of a compact manifold preserving a measure equivalent to the volume element. The only known restriction is due to A. G. Kushnirenko who proved that such a diffeomorphism must have finite entropy. On the other hand, there is a lack on general results on the smooth realization problem.

One of the most powerful tools of constructing smooth diffeomorphisms with prescribed ergodic or topological properties is the so-called approximation by conjugation-method (also known as the $AbC$-method or Anosov-Katok-method) developed by D. Anosov and A. Katok in [AK70]. In fact, on every smooth compact connected manifold $M$ of dimension $m \geq 2$ admitting a non-trivial circle
action \( S = \{ S_t \}_{t \in \mathbb{S}^1} \) preserving a smooth volume \( \nu \) this method enables the construction of smooth diffeomorphisms with specific ergodic properties (e.g. weakly mixing ones in [AK70] section 5) or non-standard smooth realizations of measure-preserving systems (e.g. [AK70] section 6) and [PSW07]). These diffeomorphisms are constructed as limits of conjugates \( f_n = H_n \circ S_{\alpha_n} \circ H_n^{-1} \), where \( \alpha_n + 1 = \alpha_n + \frac{1}{k_n} \in \mathbb{Q} \), \( H_n = H_{n-1} \circ h_n \) and \( h_n \) is a measure-preserving diffeomorphism satisfying \( S_{\frac{1}{n}} \circ h_n = h_n \circ S_{\frac{1}{n}} \). In each step the conjugation map \( h_n \) and the parameter \( k_n \) are chosen such that the diffeomorphism \( f_n \) imitates the desired property with a certain precision. Then the parameter \( l_n \) is chosen large enough to guarantee closeness of \( f_n \) to \( f_{n-1} \) in the \( C^\infty \)-topology and so the convergence of the sequence \( (f_n)_{n \in \mathbb{N}} \) to a limit diffeomorphism is provided. It is even possible to keep this limit diffeomorphism within any given \( C^\infty \)-neighbourhood of the initial element \( S_{\alpha_1} \) or, by applying a fixed diffeomorphism \( g \) first, of \( g \circ S_{\alpha_1} \circ g^{-1} \). So the construction can be carried out in a neighbourhood of any diffeomorphism conjugate to an element of the action. Thus, \( A(M) = \{ h \circ S_{\alpha} \circ h^{-1} : t \in \mathbb{S}^1, h \in \text{Diff}^\infty(M, \nu) \}^{\mathbb{N}} \) is a natural space for the produced diffeomorphisms. Moreover, we will consider the restricted space \( A_\alpha(M) = \{ h \circ S_{\alpha} \circ h^{-1} : h \in \text{Diff}^\infty(M, \nu) \}^{\mathbb{N}} \) for \( \alpha \in \mathbb{S}^1 \). Another feature of the AbC-method is the possibility to deduce statements on the genericity of the constructed properties in \( A(M) \) or \( A_\alpha(M) \): As mentioned above Anosov and Katok proved that the set of weakly mixing diffeomorphisms is generic in \( A(M) \) in the \( C^\infty(M) \)-topology. More specifically, for every Liouville number \( \alpha \) the set of weakly mixing diffeomorphisms is generic in \( A_\alpha(M) \) ([FS05], [GKu]). See also [FK04] for more details and other results of this method.

Using a smooth variant of the method of approximation by periodic transformations Stepin constructed a smooth \( \kappa \)-weakly mixing diffeomorphism in [SS71] section 4. Another construction of a smooth diffeomorphisms without the group property even in the restricted space \( A_\alpha(M) \) for arbitrary Liouville number \( \alpha \) was exhibited in [Ku10].

In this paper we construct the first smooth \((\kappa_1, \ldots, \kappa_k)\)-weakly mixing diffeomorphisms: For \( k \in \mathbb{N} \) we define the set \( \Pi_k \) of tuples \((\kappa_1, \ldots, \kappa_k) \in [0, 1]^k \) satisfying \( \kappa_1 < \kappa_2 < \cdots < \kappa_k \) as well as \( \kappa_k - \kappa_{k-1} < \kappa_{k-1} - \kappa_{k-2} < \cdots < \kappa_2 - \kappa_1 \).

**Theorem 1.** Let \( M \) be a smooth compact connected manifold of dimension \( m \geq 2 \) with a non-trivial circle action \( S = \{ S_t \}_{t \in \mathbb{S}^1} \), \( S_{t+1} = S_t \), preserving a smooth volume \( \nu \). Moreover, let \( k \in \mathbb{N} \) and \((\kappa_1, \ldots, \kappa_k) \in \Pi_k \). If \( \alpha \in \mathbb{R} \) is Liouville, then the set of volume-preserving \((\kappa_1, \ldots, \kappa_k)\)-weakly mixing diffeomorphisms contains a dense \( G_\beta \)-set in the \( C^\infty \)-topology in \( A_\alpha(M) \).

In particular, we get

**Corollary 1.** If \( \alpha \) is a Liouville number, then for a generic \( T \in A_\alpha(M) \) we have

\[
\sigma_{T^k(1)} \ast \cdots \ast \sigma_{T^k(l)} \perp \sigma_{T^{k'(1)}} \ast \cdots \ast \sigma_{T^{k'(l)}}
\]

for every \( k(1), \ldots, k(l), k'(1), \ldots, k'(l') \in \mathbb{N} \) unless \((k(1), \ldots, k(l)) \) is a permutation of \((k'(1), \ldots, k'(l')) \). In particular, the powers of \( T \) are spectrally disjoint.

At this point, we recall that two automorphisms \( T \) and \( S \) are **spectrally disjoint** if the maximal spectral types \( \sigma_T \) and \( \sigma_T \) are mutually singular. In particular, spectral disjointness implies disjointness in the sense of Furstenberg ([FK04]). Another motivation to study spectral disjointness
of different powers deals with Sarnak’s conjecture stating that for every homeomorphism \( T \) of a compact metric space \( X \) with topological entropy zero, any \( \varphi \in C(X) \) and any \( x \in X \) the sequence \( (\varphi(T^n x))_{n \in \mathbb{N}} \) is orthogonal to the Möbius function, i.e. we have

\[
\frac{1}{N} \sum_{n=1}^{N} \varphi(T^n x) \mu(n) \to 0 \text{ as } N \to \infty,
\]

where the Möbius function \( \mu : \mathbb{N} \to \mathbb{Z} \) is defined by \( \mu(1) = 1, \mu(n) = 0 \) for non-square-free positive integers and \( \mu(n) = \pm 1 \) depending on the parity of the number of prime factors for the remaining positive integers (see [Sa], [ELR14]). In fact, it is shown in [BSZ12] that the spectral disjointness of different prime powers implies the validity of a generalized version of equation (1) where \( \mu \) can be replaced by any bounded multiplicative function of the positive integers.

**Remark 1.3.** By some modifications using the conjugation maps as in [GKu] and [Ku] we are even able to construct the \((\kappa_1, \ldots, \kappa_k)\)-weakly mixing diffeomorphisms in such a way that they preserve a measurable Riemannian metric and that their projectivized derivative extension is ergodic with respect to a measure in the projectivization of the tangent bundle which is absolutely continuous in the fibers.

**Remark 1.4.** Recently, great progress has been made in extending the approximation by conjugation-method to the real-analytic category in case of the torus \( \mathbb{T}^m \), \( m \geq 2 \), in a series of papers ([Ba17], [Ka17], [BK]). All these constructions base on the concept of block-slide type maps on the torus and their sufficiently precise approximation by volume-preserving real-analytic diffeomorphisms. By this approach it is possible to adapt the constructions of this paper to show that for every \( m \in \mathbb{N}, m \geq 2, k \in \mathbb{N}, p > 0 \) and \( (\kappa_1, \ldots, \kappa_k) \in \Pi_k \) there are real-analytic \((\kappa_1, \ldots, \kappa_k)\)-weakly mixing diffeomorphisms \( T \in \text{Diff}^s_{\rho}(\mathbb{T}^m, \mu) \). We are going to present the details in a forthcoming paper.

## 2 Preliminaries

We use the definitions and notations introduced in [Ka16] subsection 1.1.

### 2.1 First steps of the proof

First of all we show how constructions on \( \mathbb{S}^1 \times [0, 1]^{m-1} \) can be transfered to a general compact connected smooth manifold \( M \) with a non-trivial circle action \( \mathcal{S} = \{S_t\}_{t \in \mathbb{R}}, S_{t+1} = S_t \). By [AK70] Proposition 2.1] we can assume that 1 is the smallest positive number satisfying \( S_t = \text{id} \). Hence, we can assume \( \mathcal{S} \) to be effective. We denote the set of fixed points of \( \mathcal{S} \) by \( F \) and for \( q \in \mathbb{N} \) \( F_q \) is the set of fixed points of the map \( S_{\frac{1}{q}} \). On the other hand, we consider \( \mathbb{S}^1 \times [0, 1]^{m-1} \) with Lebesgue measure \( \mu \). Furthermore let \( \mathcal{R} = \{R_\alpha\}_{\alpha \in \mathbb{S}^1} \) be the standard action of \( \mathbb{S}^1 \) on \( \mathbb{S}^1 \times [0, 1]^{m-1} \), where the map \( R_\alpha \) is given by \( R_\alpha(\theta, r_1, \ldots, r_{m-1}) = (\theta + \alpha, r_1, \ldots, r_{m-1}) \). Hereby we can formulate the following result (see [FSW07] Proposition 1):

**Proposition 2.1.** Let \( M \) be a \( m \)-dimensional smooth, compact and connected manifold admitting an effective circle action \( \mathcal{S} = \{S_t\}_{t \in \mathbb{R}}, S_{t+1} = S_t \), preserving a smooth volume \( \nu \). Let \( B := \partial M \cup F \cup \bigcup_{q \geq 1} F_q \). There exists a continuous surjective map \( G : \mathbb{S}^1 \times [0, 1]^{m-1} \to M \) with the following properties:

4
1. The restriction of $G$ to $S^1 \times (0, 1)^{m-1}$ is a $C^\infty$-diffeomorphic embedding.

2. $\nu\left(G\left(\partial \left(S^1 \times [0, 1]^{m-1}\right)\right)\right) = 0$

3. $G\left(\partial \left(S^1 \times [0, 1]^{m-1}\right)\right) \supseteq B$

4. $G_* (\mu) = \nu$

5. $S \circ G = G \circ R$

By the same reasoning as in [FSW07 section 2.2] this proposition allows us to carry a construction from $\left(S^1 \times [0, 1]^{m-1}, R, \mu\right)$ to the general case $(M, S, \nu)$: Suppose $f : S^1 \times [0, 1]^{m-1} \to S^1 \times [0, 1]^{m-1}$ is a $(\kappa_1, \ldots, \kappa_k)$-weakly mixing diffeomorphism sufficiently close to $R_\alpha$ in the $C^\infty$-topology obtained by $f = \lim_{n \to \infty} f_n$ with $f_n = H_n \circ R_{\alpha_{n+1}} \circ H_n^{-1}$, where $f_n = R_{\alpha_{n+1}}$ in a neighbourhood of the boundary (in Proposition 2.2 we will see that these conditions can be satisfied in the constructions of this article). Then we define a sequence of diffeomorphisms:

$$f_n : M \to M \quad \tilde{f}_n (x) = \begin{cases} G \circ f_n \circ G^{-1} (x) & \text{if } x \in G \left(S^1 \times (0, 1)^{m-1}\right) \\ S_{\alpha_{n+1}} (x) & \text{if } x \notin G \left(S^1 \times (0, 1)^{m-1}\right) \end{cases}$$

Constituted in [FK04 section 5.1] (which bases upon [Ka79 Proposition 1.1]), this sequence is convergent in the $C^\infty$-topology to the diffeomorphism

$$\tilde{f} : M \to M \quad \tilde{f} (x) = \begin{cases} G \circ f \circ G^{-1} (x) & \text{if } x \in G \left(S^1 \times (0, 1)^{m-1}\right) \\ S_\alpha (x) & \text{if } x \notin G \left(S^1 \times (0, 1)^{m-1}\right) \end{cases}$$

provided the closeness from $f$ to $R_\alpha$ in the $C^\infty$-topology.

We observe that $f$ and $\tilde{f}$ are metrically isomorphic. Then $\tilde{f}$ is $(\kappa_1, \ldots, \kappa_k)$-weakly mixing because the $(\kappa_1, \ldots, \kappa_k)$-weak mixing property is invariant under isomorphisms.

Altogether the construction done in the case of $(S^1 \times [0, 1]^{m-1}, R, \mu)$ is transferred to $(M, S, \nu)$. Hence it suffices to consider constructions on $M = S^1 \times [0, 1]^{m-1}$ with circle action $R$ subsequently. In this case we will prove the following result:

**Proposition 2.2.** For every $k \in \mathbb{N}$, $(\kappa_1, \ldots, \kappa_k) \in \Pi_k$ and every Liouvillean number $\alpha$ there is a sequence $(\alpha_n)_{n \in \mathbb{N}}$ of rational numbers $\alpha_n = \frac{p_n}{q_n}$ satisfying $\lim_{n \to \infty} |\alpha - \alpha_n| = 0$ monotonically and sequences $(g_n)_{n \in \mathbb{N}}, (\phi_n)_{n \in \mathbb{N}}$ of measure-preserving diffeomorphisms satisfying $g_n \circ R_{\frac{1}{m}} = R_{\frac{1}{m}} \circ g_n$ as well as $\phi_n \circ R_{\frac{1}{m}} = R_{\frac{1}{m}} \circ \phi_n$ such that the diffeomorphisms $f_n = H_n \circ R_{\alpha_{n+1}} \circ H_n^{-1}$ with $H_n = h_1 \circ h_2 \circ \ldots \circ h_n$, where $h_n = g_n \circ \phi_n$, coincide with $R_{\alpha_{n+1}}$ in a neighbourhood of the boundary, converge in the $\text{Diff}^\infty (M)$-topology and the diffeomorphism $f = \lim_{n \to \infty} f_n$ is $(\kappa_1, \ldots, \kappa_k)$-weakly mixing and satisfies $\tilde{f} \in \mathcal{A}_\alpha (M)$.

Furthermore for every $\varepsilon > 0$ the parameters in the construction can be chosen in such a way that $d_{\infty} (f, R_\alpha) < \varepsilon$. 

5
2.2 Outline of the proof

The constructions are based on the “approximation by conjugation”-method developed by D.V. Anosov and A. Katok in [AK70]. Here one constructs successively a sequence of volume-preserving diffeomorphisms $f_n = H_n \circ S_{\alpha_{n+1}} \circ H_n^{-1}$, where the conjugation maps $H_n = h_1 \circ ... \circ h_n$ and the rational numbers $\alpha_n = \frac{\eta_n}{n}$ are chosen in such a way that the functions $f_n$ converge to a diffeomorphism $f$ with the aimed properties.

First of all, we will define the conjugation map $h_n$ as a composition of two volume-preserving diffeomorphisms $h_n = g_n \circ \phi_n$. Here, $g_n$ is the shear $g_n(\theta, r_1, \ldots, r_{m-1}) = (\theta + nq_n \cdot r_1, r_1, \ldots, r_{m-1})$ and $\phi_n$ is a step-by-step defined smooth volume-preserving diffeomorphism. Its construction in section 3.1 is based on maps of the form $\phi_\lambda^{(j)} = C_\lambda^{-1} \circ \varphi_{1,j} \circ C_\lambda$ with $C_\lambda$ being a stretching by $\lambda \in \mathbb{N}$ in the first coordinate and $\varphi_{1,j}$ a “quasi-rotation”, i.e. a rotation by $\frac{\pi}{2}$ in the $x_1-x_j$-coordinates on large part of the domain. In fact, $\phi_n$ will be of the form $\phi^{(m)}_{\lambda_m} \circ \cdots \circ \phi^{(2)}_{\lambda_2}$ with explicitly chosen parameters $\lambda_j \in \mathbb{N}$, $\lambda_j < \lambda_{j+1}$, on the different sections. Moreover, we define a sequence of partial partitions $\eta_n$ whose elements have such a small diameter that even the image under $H_{n-1} \circ g_n$ converges to the decomposition into points. We will prove the $(\kappa_1, \ldots, \kappa_k)$-weak mixing property on those partition elements.

Like the criteria for weak mixing in [FS05], [GKu] and [Ku] we use the concept of “almost uniform distribution”. Descriptively, a set of small diameter is “almost uniformly distributed” under a diffeomorphism $\Phi$ if it is mapped to a set of small width in the $\theta$-coordinate and almost full length in the $r_1,\ldots,r_{m-1}$-coordinates in an uniform way (see Definition 4.1 for the precise definition). In our case $\Phi_n = \phi_n \circ R_{\alpha_{n+1}} \circ \phi_n^{-1}$ with a specific sequence $(\alpha_n)_{n \in \mathbb{N}}$ of natural numbers such that $R_{\alpha_{n+1}}$ causes a translation by $\frac{1}{nq_n}$ to the adjacent domain of definition of the map $\phi_n$ (see section 4). In Lemma 4.5 we make the key observation that

$$\phi^{(m)}_{\lambda_m} \circ \cdots \circ \phi^{(2)}_{\lambda_2} \circ R_{\alpha_{n+1}} \circ \left( \phi^{(2)}_{\lambda_2} \right)^{-1} \circ \left( \phi^{(m)}_{\lambda_m} \right)^{-1}$$

almost uniformly distributes an element of the partition $\eta_n$ if $\mu_j > \lambda_j$ for each $j = 2,\ldots,m$. On the other hand, we observe that $\Phi_n$ acts approximately as the translation by $R_{\frac{1}{nq_n}}$ if $\mu_j = \lambda_j$. On this account, the choice of parameters $\lambda_j$ in the definition of $\phi_n$ is exactly done in such a way that after a translation by $R_{\frac{1}{nq_n}}$ we have an increase of the $\lambda$-values on a portion of about $\kappa_i$ of the partition element (see Lemma 4.6). Thus, we will have “almost uniform distribution” under $\Phi_i$ on a portion of about $\kappa_i$ of the partition element. The subsequent application of the shear $g_n$ will cause that this is almost uniformly distributed on the whole manifold $\mathbb{S}^1 \times [0,1]^{m-1}$. In section 6 we will establish the $(\kappa_1,\ldots,\kappa_k)$-weak mixing property in our construction.

In section 6 we will show convergence of the sequence $(f_n)_{n \in \mathbb{N}}$ in $\mathcal{A}_\alpha$ for a given Liouville number $\alpha$ by the same approach as in [FS05]. For this purpose, we have to estimate the norms $|||H_n|||$ very carefully.

3 Explicit constructions

We fix $(\kappa_1,\ldots,\kappa_k) \in \Pi_k$ and an arbitrary Liouvillean number $\alpha \in \mathbb{S}^1$. We also introduce the notation $\tilde{\beta}_1 = \kappa_1$, $\tilde{\beta}_i = \kappa_i - \kappa_{i-1}$ for $i = 2,\ldots,k$. Obviously, $\sum_{i=1}^{d} \tilde{\beta}_i = \kappa_d$. In particular, we have
\[ \sum_{i=1}^{k} \tilde{\beta}_i = \kappa_k \leq 1. \] By the requirements on tuples in \( \Pi_k \) we also have
\[ \sum_{i=1}^{k} \tilde{\beta}_i > k \cdot \tilde{\beta}_2, \quad \tilde{\beta}_i > \tilde{\beta}_{i+1} \] for every \( i = 2, \ldots, k - 1 \).

Moreover, let \( (\tilde{\beta}_{i,n})_{n \in \mathbb{N}} \) be a sequence of rational numbers \( \tilde{\beta}_{i,n} = \frac{c_{i,n}}{d_n} \) satisfying \( \tilde{\beta}_{i,n} \to \tilde{\beta}_i \) as \( n \to \infty \) as well as the relations
\[ \sum_{i=1}^{k} \tilde{\beta}_{i,n} > k \cdot \tilde{\beta}_{2,n}, \quad \tilde{\beta}_{i,n} > \tilde{\beta}_{i+1,n} \] for every \( i = 2, \ldots, k - 1 \).

With the aid of these we also introduce the numbers \( u_{i,n} \in \mathbb{Z}, \quad i = 0, \ldots, k - 1 \) such that
\[ u_{i,n} = d_n \cdot (\tilde{\beta}_{2,n} - \tilde{\beta}_{2+i,n}) \] for \( i = 0, \ldots, k - 2 \), \( u_{k-1,n} = d_n \cdot \tilde{\beta}_{2,n} = c_{2,n} \).

In particular, we have \( u_{0,n} = 0 \) and \( u_{i+1,n} > u_{i,n} \).

Finally, we also introduce the numbers
\[ \kappa_{i,n} = \sum_{d=1}^{i} \tilde{\beta}_{d,n} \] for \( i = 1, \ldots, k \).

Since \( \tilde{\beta}_{d,n} \to \tilde{\beta}_d \) for \( n \to \infty \), we also have \( \kappa_{i,n} \to \kappa_i \).

### 3.1 The conjugation map \( \phi_n \)

The construction of the conjugation map \( \phi_n \) bases on the following “pseudo-rotations” inspired by [FS05].

**Lemma 3.1.** For every \( \varepsilon \in (0, \frac{1}{4}) \) and every \( i, j \in \{1, \ldots, m\} \) there exists a smooth measure-preserving diffeomorphism \( \varphi_{\varepsilon,i,j} \) on \( \mathbb{R}^m \), which is the rotation in the \( x_i - x_j \)-plane by \( \pi/2 \) about the point \( \left( \frac{1}{2}, \ldots, \frac{1}{2} \right) \in \mathbb{R}^m \) on \( [2\varepsilon, 1 - 2\varepsilon]^m \) and coincides with the identity outside of \( [\varepsilon, 1 - \varepsilon]^m \).

**Proof.** See [Ku16, Lemma 4.1].

Furthermore, for \( \lambda \in \mathbb{N} \) we define the maps \( C_\lambda(x_1, x_2, \ldots, x_m) = (\lambda \cdot x_1, x_2, \ldots, x_m) \). Using these maps we build the smooth measure-preserving diffeomorphism
\[ \phi_{\lambda,\varepsilon,j} : \left[ 0, \frac{1}{\lambda} \right] \times [0, 1]^{m-1} \to \left[ 0, \frac{1}{\lambda} \right] \times [0, 1]^{m-1}, \quad \phi_{\lambda,\varepsilon,j} = C_\lambda^{-1} \circ \varphi_{\varepsilon,1,j} \circ C_\lambda \]

Afterwards \( \phi_{\lambda,\varepsilon,j} \) is extended to a diffeomorphism on \( \mathbb{S}^1 \times [0, 1]^{m-1} \) by the description
\[ \phi_{\lambda,\varepsilon,j} \left( x_1 + \frac{1}{\lambda}, x_2, \ldots, x_m \right) = \left( \frac{1}{\lambda}, 0, 0, \ldots, 0 \right) + \phi_{\lambda,\varepsilon,j} \left( x_1, x_2, \ldots, x_m \right). \]

For convenience we will use the notation \( \phi_{\lambda,(j)} = \phi_{\lambda,\varepsilon_{1,\lambda}(j)} \). By construction the map \( \phi_{\lambda,\varepsilon,j} \) satisfies the following properties: This map satisfies the following properties:
Proposition 3.2. Let \( j \in \{2, \ldots, m\} \), \( \varepsilon \in (0, \frac{1}{4}) \) and \( \lambda \in \mathbb{N} \). Moreover, let \( t_0 \in \mathbb{Z} \), \( \mu_s \in \mathbb{N} \), \( t_s \in \mathbb{Z} \), \( \lfloor 2\varepsilon \mu_s \rfloor \leq t_s < \mu_s - \lfloor 2\varepsilon \mu_s \rfloor \), for \( s = 1, \ldots, m \). Then we have

1.

\[
\phi_{\lambda, \varepsilon, j}^{-1} \left( \left[ \frac{t_0}{\lambda} + \frac{t_1}{\lambda \cdot \mu_1}, \frac{t_0}{\lambda} + \frac{t_1 + 1}{\lambda \cdot \mu_1} \right] \times \prod_{s=2}^{m} \left[ \frac{t_s}{\mu_s}, \frac{t_s + 1}{\mu_s} \right] \right)
\]

\[
= \left[ \frac{t_0}{\lambda} + \frac{t_j}{\lambda \mu_j}, \frac{t_0}{\lambda} + \frac{t_j + 1}{\lambda \mu_j} \right] \times \prod_{s=2}^{j-1} \left[ \frac{t_s}{\mu_s}, \frac{t_s + 1}{\mu_s} \right] \times \left[ 1 - \frac{t_1 + 1}{\mu_1}, 1 - \frac{t_1}{\mu_1} \right] \times \prod_{s=j+1}^{m} \left[ \frac{t_s}{\mu_s}, \frac{t_s + 1}{\mu_s} \right]
\]

2.

\[
\phi_{\lambda, \varepsilon, j} \left( \left[ \frac{t_0 + \varepsilon}{\lambda}, \frac{t_0 + 1 - 2\varepsilon}{\lambda} \right] \times \prod_{s=2}^{m} \left[ \frac{t_s}{\mu_s}, \frac{t_s + 1}{\mu_s} \right] \right)
\]

\[
= \left[ \frac{t_0 + 1}{\lambda} - \frac{t_j + 1}{\lambda \mu_j}, \frac{t_0 + 1}{\lambda} - \frac{t_j}{\lambda \mu_j} \right] \times \prod_{s=2}^{j-1} \left[ \frac{t_s}{\mu_s}, \frac{t_s + 1}{\mu_s} \right] \times \left[ 2\varepsilon, 1 - 2\varepsilon \right] \times \prod_{s=j+1}^{m} \left[ \frac{t_s}{\mu_s}, \frac{t_s + 1}{\mu_s} \right]
\]

In particular, we get

\[
\phi_{\lambda, \varepsilon, j} \left( \left[ \frac{t_0 + \varepsilon}{\lambda}, \frac{t_0 + 1 - 2\varepsilon}{\lambda} \right] \times \prod_{s=2}^{m} \left[ \frac{t_s}{\mu_s}, \frac{t_s + 1}{\mu_s} \right] \right)
\]

\[
= \left[ \frac{t_0 + 1}{\lambda} - \frac{t_j + 1}{\lambda \mu_j}, \frac{t_0 + 1}{\lambda} - \frac{t_j}{\lambda \mu_j} \right] \times \prod_{s=2}^{j-1} \left[ \frac{t_s}{\mu_s}, \frac{t_s + 1}{\mu_s} \right] \times \left[ 2\varepsilon, 1 - 2\varepsilon \right] \times \prod_{s=j+1}^{m} \left[ \frac{t_s}{\mu_s}, \frac{t_s + 1}{\mu_s} \right]
\]

We start to define the diffeomorphism \( \phi_n \) on the sector \( \left[ \frac{l}{w q_0} + \frac{v}{n^2 q_n}, \frac{l}{w q_0} + \frac{v}{n^2 q_n} \right] \times [0, 1]^{m-1} \)

for each \( l, v \in \mathbb{Z} \), \( 0 \leq l < n \), \( 0 \leq v < nq_n \).

In a first step, we consider domains of the form

\[
\Delta_{l, v, s, u} = \left[ \frac{l}{n q_n} + \frac{u}{n^2 q_n}, \frac{l}{n q_n} + \frac{u}{n^2 q_n} \right] \times [0, 1]^{m-1},
\]

where \( s, u \in \mathbb{Z} \), \( 0 \leq s < k \) and \( 0 \leq u < c_{2, n} \).

We define \( s \equiv -l \mod k \). Then for every \( s \in \mathbb{Z} \), \( 0 \leq s < k \), there is a unique \( t \in \{0, 1, \ldots, k-1\} \) such that \( s \equiv s + t \mod k \). Recall the numbers \( u_{i, n}, 0 \leq i < k-1 \), from equation \[2\]

- If the number \( u \in \mathbb{Z} \), \( 0 \leq u < c_{2, n} \), satisfies \( u_{i, n} \leq u < u_{i+1, n} \) with \( i \geq t - 1 \), then we put

\[
\phi_n = \phi_{d_n \cdot (n q_n)^2 \cdot (m-1) \cdot (i+k-t)}^{(m)} \circ \cdots \circ \phi_{d_n \cdot (n q_n)^2 \cdot (i+k-t)}^{(3)} \circ \phi_{d_n \cdot (n q_n)^2 \cdot (i+k-t)}^{(2)}
\]

on the domain \( \Delta_{l, v, s, u} \).

- If the number \( u \in \mathbb{Z} \), \( 0 \leq u < c_{2, n} \), satisfies \( u_{i, n} \leq u < u_{i+1, n} \) with \( i < t - 1 \), then we put

\[
\phi_n = \phi_{d_n \cdot (n q_n)^2 \cdot (m-1) \cdot (i+k)}^{(m)} \circ \cdots \circ \phi_{d_n \cdot (n q_n)^2 \cdot (i+k)}^{(3)} \circ \phi_{d_n \cdot (n q_n)^2 \cdot (i+k)}^{(2)}
\]

on the domain \( \Delta_{l, v, s, u} \).
In the next step we recall the requirements \( \sum_{i=1}^{k} \tilde{\beta}_{i,n} > k \cdot \tilde{\beta}_{2,n} \) and \( \sum_{i=1}^{k} \tilde{\beta}_{i,n} \leq 1 \). Then we put
\[
\phi_n = \phi_{d_n/q_n, q_n^2}^{(m)} \circ \cdots \circ \phi_{d_n/q_n, q_n^2}^{(3)} \circ \phi_{d_n/q_n, q_n^2}^{(2)} \circ \phi_{d_n/q_n, q_n^2}^{(1)}
\]
on the domain
\[
\left[ \frac{l}{n \cdot q_n} + \frac{v}{n^2 \cdot q_n^2} + \frac{k \cdot c_{2,n}}{d_n \cdot n^2 \cdot q_n^2}, \frac{l}{n \cdot q_n} + \frac{v}{n^2 \cdot q_n^2} + \frac{\sum_{i=1}^{k} c_{i,n}}{d_n \cdot n^2 \cdot q_n^2} \right] \times [0, 1]^{m-1}.
\]

Finally, we put
\[
\phi_n = \text{id}
on the domain
\[
\left[ \frac{l}{n \cdot q_n} + \frac{v}{n^2 \cdot q_n^2} + \frac{\sum_{i=1}^{k} c_{i,n}}{d_n \cdot n^2 \cdot q_n^2}, \frac{l}{n \cdot q_n} + \frac{v+1}{n^2 \cdot q_n^2} \right] \times [0, 1]^{m-1}.
\]

This is a smooth map because \( \phi_n \) coincides with the identity in a neighbourhood of the different sections.

Hereby, we have defined the diffeomorphism \( \phi_n \) on the fundamental sector \([0, 1/q_n] \times [0, 1]^{m-1}\). Now we extend \( \phi_n \) to a diffeomorphism on \( S^1 \times [0, 1]^{m-1} \) using the description \( \phi_n \circ R_{1/n} = R_{1/n} \circ \phi_n \).

Example 3.3. Let \( \kappa_1 = \frac{1}{2} \), \( \kappa_2 = \frac{3}{4} \) and \( \kappa_3 = \frac{7}{8} \). Since \( \kappa_3 - \kappa_2 = \frac{1}{8} < \frac{1}{4} = \kappa_2 - \kappa_1 \) and \( 3 \cdot (\kappa_2 - \kappa_1) = \frac{3}{4} < \frac{7}{8} = \kappa_3 \) we have \((\kappa_1, \kappa_2, \kappa_3) \in \Pi_3\). In Figure 1 we list the powers \( \gamma \) of \( \phi_{d_n/q_n, q_n^2}^{(2)} \) on a domain \([l/n \cdot q_n, l/n \cdot q_n + v/n^2 \cdot q_n^2] \times [0, 1] \) for different values of \( l \in \mathbb{Z} \).

Figure 1: List of powers \( \gamma \) of \( \phi_{d_n/q_n, q_n^2}^{(2)} \) on a domain \([l/n \cdot q_n, l/n \cdot q_n + v/n^2 \cdot q_n^2] \times [0, 1] \) for different values of \( l \in \mathbb{Z} \). In the horizontal direction we have the portions of the length \( 1/n \cdot q_n \) of the domain.
3.2 The conjugation map $h_n$

We define the conjugation map as the composition

$$h_n = g_n \circ \phi_n,$$

where

$$g_n (\theta, r_1, \ldots, r_{m-1}) = (\theta + n q_n \cdot r_1, \ldots, r_{m-1}).$$

3.3 Partial partition $\eta_n$

In this subsection we define the announced sequence of partial partitions $(\eta_n)_{n \in \mathbb{N}}$ of $M = S^1 \times [0, 1]^{m-1}$.

**Remark 3.4.** For convenience we will use the notation $\prod_{r=2}^{m} [a_r, b_r]$ for $[a_2, b_2] \times \ldots \times [a_m, b_m]$.

Initially $\eta_n$ will be constructed on the fundamental sector $[0, 1/q_n] \times [0, 1]^{m-1}$. We start by considering the following sets: In the $\theta$-coordinate we define

$$\tilde{I}_{l, v, u} := \left[ l/nq_n + \frac{v}{(nq_n)^2}, \frac{v}{(nq_n)^2} + \frac{u}{d_n \cdot (nq_n)^2} + \frac{t_1(2)}{d_n \cdot (nq_n)^2} + \ldots + \frac{t_1^{(m-(n-1+k))}}{d_n \cdot (nq_n)^2(m-(n-1+k))} + \frac{1}{10n^4 \cdot d_n \cdot (nq_n)^2(m-(n-1+k))} \right],$$

and

$$\tilde{I}_{l} := \left[ l/nq_n + \frac{v + \sum_{d=1}^{k} \beta_{d,n}}{n^2 \cdot q_n^2} + \frac{1}{2 \cdot n^2 \cdot q_n^2} \cdot \left( 1 - \left( 1 - \frac{1}{5n^4} \right)^{m-(n-1+k)-1} \right) \right].$$

In the $r$-coordinates we define

$$W := \left[ \frac{1}{j_2(1)} + \frac{1}{j_2(2)} + \ldots + \frac{1}{j_2(m-(n-1+k))}, \frac{1}{j_2(1)} + \frac{1}{j_2(2)} + \ldots + \frac{1}{j_2(m-(n-1+k))} \right].$$
In case of \( l, v \in \mathbb{Z}, 0 \leq l < n \) and \( 0 \leq v < nq_n \), we define
\[
I_{l,v,j_2(1),j_2(2),j_3,\ldots,j_m} := \bigcup \left( \tilde{I}_{l,v,u,j_2(1)} \times W_{j_2(1),j_2(2),j_3,\ldots,j_m} \right),
\]
where the union is taken over
- \( u \in \mathbb{Z}, 0 \leq u < \sum_{d=1}^k c_{d,n} \)
- \( t_1^{(s)} \in \mathbb{Z}, \left[ \frac{q_n^2}{10n^n} \right] \leq t_1^{(s)} \leq q_n^2 - \left[ \frac{q_n^2}{10n^n} \right] - 1 \), for \( s = 2, \ldots, m \cdot (n - 1 + k) \)
- \( t_4^{(s)} \in \mathbb{Z}, \left[ \frac{q_n^2}{10n^n} \right] \leq t_4^{(s)} \leq q_n^2 - \left[ \frac{q_n^2}{10n^n} \right] - 1 \), for \( s = 2, \ldots, n - 1 + k \) and \( i = 2, \ldots, m \).

In Lemma 6.9 we will choose \( q_n \) as a multiple of \( 10n^2 \). In particular, \( \left[ \frac{q_n^2}{10n^n} \right] = q_n^2 \).

**Remark 3.5.** Descriptively, \( I_{l,v,j_2(1),j_2(2),j_3,\ldots,j_m} \) is the cube
\[
\left[ \frac{l}{nq_n} + \frac{v}{n^2q_n^2}, \frac{l+1}{nq_n} \right] \times \left[ \frac{q_n^2}{n^2q_n^2}, \frac{q_n^2}{n^2q_n^2} \right] \times \left[ \frac{j_2(1)}{nq_n^2}, \frac{j_2(1) + 1}{nq_n^2} \right] \times \prod_{i=3}^m \left[ \frac{j_i}{nq_n^2}, \frac{j_i + 1}{nq_n^2} \right]
\]
with some holes. These holes are inserted in order to guarantee that \( I_{l,v,j_2(1),j_2(2),j_3,\ldots,j_m} \) belongs to the "good domain" of \( \tilde{\phi}_n^{-1} \) and also of \( \phi_n \) after a translation by \( \frac{l}{nq_n} \) on the \( \theta \)-axis. This property will be exploited in the proof of Lemma 4.5.

With the aid of these sets we define our partial partition \( \eta_n \):
- On \( \left[ \frac{l}{nq_n}, \frac{l+1}{nq_n} \right] \times [0,1]^{m-1}, 0 \leq l < n-k \), the partial partition \( \eta_n \) consists of all such sets
  \( I_{l,v,j_2(1),j_2(2),j_3,\ldots,j_m} \) at which \( j_i \in \mathbb{Z} \) and \( \left[ \frac{q_n^2}{10n^n} \right] \leq j_i \leq q_n^2 - \left[ \frac{q_n^2}{10n^n} \right] - 1 \) for \( i = 3, \ldots, m \) and \( v \in \mathbb{Z}, 0 \leq v \leq n \cdot q_n - 1 \), as well as \( j_2(1) \in \mathbb{Z}, \left[ \frac{q_n^2}{10n^n} \right] \leq j_2(1) \leq q_n^2 - \left[ \frac{q_n^2}{10n^n} \right] - 1 \) as well as \( j_2(2) \in \mathbb{Z}, 0 \leq j_2(2) \leq n-1 \) apart from those \( j_2(2) \) satisfying
  \( l + j_2(2) \equiv n-s \mod n \) for \( s = 1, 2, \ldots, k+1 \).
- On \( \left[ \frac{n-k}{nq_n}, \frac{1}{q_n} \right] \times [0,1]^{m-1} \) there are no elements of the partial partition \( \eta_n \).

As the image under \( R_{a/q_n} \) with \( a \in \mathbb{Z} \) this partial partition of \( \left[ 0, \frac{1}{q_n} \right] \times [0,1]^{m-1} \) is extended to a partial partition of \( S^1 \times [0,1]^{m-1} \).

**Remark 3.6.** By construction this sequence of partial partitions converges to the decomposition into points.

**Remark 3.7.** In the following we will often write a partition element in the comprehensive form \( \tilde{I}_n = \bigcup_{j=0}^N I_j \times W \), at which \( W = \pi_F(\tilde{I}_n) \) is the \( m-1 \)-dimensional projection of \( \tilde{I}_n \) in the \( r_1, \ldots, r_{m-1} \)-coordinates and we have the following sections \( I_j \) on the \( \theta \)-axis: If \( \phi_n = \tilde{\phi}_d(nq_n)^2 \).
The sections on this domain are given by \( I_j = \bigcup \tilde{I}_{I_j}^{(T+1)}, \ldots, \tilde{I}_{I_j}^{(m-n+1)} \), where the union is taken over the allowed values of \( \ell^{(m-n+1)}_1, \ldots, \ell^{(T+1)}_1 \).

Finally, \( I_{\text{N}} \) corresponds to the section \( \tilde{I}_{I_1}^{(l,v)} \), i.e.

\[
\left[ \frac{l}{n \cdot q_n} + \frac{v}{n^2 \cdot q_n^2} - \frac{1 - \sum_{d=1}^k \beta_{d,n}}{2 \cdot n^2 \cdot q_n^2} \cdot \left( \frac{1}{5n^4} \right)^{m-n+1} \right] \]

Note that the partition elements are constructed in such a way that

\[
\mu(I_{\text{N}} \times W) = \left( 1 - \sum_{d=1}^k \beta_{d,n} \right) \cdot \mu(\tilde{I}_n).
\]

**Remark 3.8.** For an element \( \tilde{I}_n = \bigcup_{j=0}^N I_j \times W \) of the partition \( \eta_n \) we observe:

\[
\phi_n|_{I_{\text{N}} \times W} = \text{id}
\]

**Remark 3.9.** The additional restrictions on \( j^{(2)}_2 \) will be helpful in Remark 5.5.

### 4 \((\gamma, \delta, s, \epsilon)-distribution\)

We introduce the central notion in the proof of the criterion for \((\kappa_1, \ldots, \kappa_k)\)-weak mixing deduced in the next section:

**Definition 4.1.** Let \( \Phi : M \to M \) be a diffeomorphism. We say \( \Phi (\gamma, \delta, s, \epsilon) \)-distributes a set \( \tilde{I} \), if the following properties are satisfied:

- \( \Phi (\tilde{I}) \) is contained in a set of the form \([c, c + \gamma] \times [\delta, 1 - \delta]^{m-1}\) for some \( c \in \mathbb{S}^1 \).

- For every \((m-1)\)-dimensional cuboid \( \tilde{J} \subseteq J \) of \( r_1 \)-length at least \( s_1 \) and of side length \( s \) in the \( r_2, \ldots, r_{m-1} \)-coordinates it holds:

\[
\left| \mu(\tilde{I} \cap \tilde{J}) - \mu^{(m-1)}(\tilde{I}) \cdot \mu^{(m-1)}(\tilde{J}) \right| \leq \epsilon \cdot \mu(\tilde{I}) \cdot \mu^{(m-1)}(\tilde{J}).
\]

where \( \mu^{(m-1)} \) is the Lebesgue measure on \([0, 1]^{m-1}\).

**Remark 4.2.** Inspired by [FS05], we will call the second property “almost uniform distribution” of \( \tilde{I} \) in the \( r_1, \ldots, r_{m-1} \)-coordinates.

In the next step we define the sequence of natural numbers \((m_n)_{n \in \mathbb{N}}\):

\[
m_n = \min \left\{ m \leq q_{n+1} : m \in \mathbb{N}, \inf_{k \in \mathbb{Z}} \left| \frac{m \cdot p_{n+1}}{q_{n+1}} - \frac{1}{n \cdot q_n} + k \right| \leq \frac{10n^2}{q_{n+1}} \right\}
\]

\[12\]
Lemma 4.3. The set \( M_n := \left\{ m \leq q_{n+1} : m \in \mathbb{N}, \inf_{k \in \mathbb{Z}} |m \cdot \frac{p_{n+1}}{q_{n+1}} - \frac{1}{n \cdot q_n} + k| \leq \frac{10n^2}{q_{n+1}} \right\} \) is nonempty for every \( n \in \mathbb{N} \), i.e. \( m_n \) exists.

**Proof.** In Lemma 6.9 we will construct the sequence \( \alpha_n = \frac{p_n}{q_n} \) in such a way, that \( q_n = 10n^2 \cdot \tilde{q}_n \) and \( p_n = 10n^2 \cdot \tilde{p}_n \) with \( \tilde{q}_n, \tilde{p}_n \) relatively prime. Therefore the set \( \left\{ j \cdot \frac{p_{n+1}}{q_{n+1}} : j = 1, 2, ..., q_{n+1} \right\} \) contains \( \frac{q_{n+1}}{10n^2} \) different equally distributed points on \( S^1 \). Hence for every \( x \in S^1 \) there is a \( j \in \{1, ..., q_{n+1}\} \), such that \( \inf_{k \in \mathbb{Z}} |x - j \cdot \frac{p_{n+1}}{q_{n+1}} + k| \leq \frac{10n^2}{q_{n+1}} \). In particular this is true for \( x = \frac{1}{n \cdot q_n} \).

\( \Box \)

**Remark 4.4.** We define

\[
a_n = \left( m_n \cdot \frac{p_{n+1}}{q_{n+1}} - \frac{1}{n \cdot q_n} \right) \mod 1
\]

By the above construction of \( m_n \) it holds: \( |a_n| \leq \frac{10n^2}{q_{n+1}} \). In Lemma 6.9 we will see that it is possible to choose \( q_{n+1} \geq 200 \cdot n^2 \cdot k \cdot d_n^2 \cdot n^{4(n+k)} \cdot q_n^{4(n-1+k)} \). Thus we get:

\[
|a_n| \leq \frac{1}{20n^4 \cdot k \cdot d_n^2 \cdot (n \cdot q_n)^{4(n-1+k)}}
\]

By this choice of the number \( m_n \), \( R_{\alpha_n+1}^{m_n} \) causes a translation to the adjacent \( \frac{1}{n q_n} \)-domain of definition of the map \( \phi_n \). On such a domain the elements \( \tilde{I}_n \) of the partial partition \( \eta_n \) are positioned in such a way that all \( \varphi_{\epsilon,1,j} \) act as the particular rotations. On the adjacent section, the stretching parameters \( \lambda_j \) in \( \phi^{(j)}_{\lambda_j} \) are chosen so that either \( \phi_n \) is of the same form as before or \( \phi_n \) maps \( R_{\alpha_n+1}^{m_n} \circ \phi_n^{-1} (\tilde{I}_n) \) to a set of almost full length in the \( r_1, ..., r_{m-1} \)-coordinates. We make this precise in the subsequent lemma.

**Lemma 4.5.** We consider a set \( I_n \) belonging to a partition element of \( \eta_n \) of the form

\[
\bigcup \left[ \frac{t_1^{(T+1)}}{d_n \cdot (n \cdot q_n)^{2(T+1)}} + ... + \frac{t_1^{(m-1+k)}}{d_n \cdot (n \cdot q_n)^{2m(n-1+k)}} + \frac{1}{10n^4 \cdot d_n \cdot (n \cdot q_n)^{2m(n-1+k)}}, \bigg( \frac{1}{d_n \cdot (n \cdot q_n)^{2(T+1)}} + ... + \frac{1}{d_n \cdot (n \cdot q_n)^{2m(n-1+k)}} \right] \bigg)
\]

\[
\times \prod_{i=2}^{m} \left[ \frac{j_i^{(1)}}{(n q_n)^{2(1)}} + ... + \frac{j_i^{(n-1+k)}}{(n q_n)^{2(n-1+k)}} + \frac{1}{10n^4 \cdot (n q_n)^{2(n-1+k)}}, \bigg( \frac{j_i^{(1)}}{(n q_n)^{2(1)}} + ... + \frac{j_i^{(n-1+k)}}{(n q_n)^{2(n-1+k)}} + \frac{1}{10n^4 \cdot (n q_n)^{2(n-1+k)}} \right] \right)
\]

where the union is taken over all occurring \( t_i^{(j)} \), and assume that

\[
\phi_n = \phi^{(1)}_{d_{n}(n q_n)^{2(m-1)}} \circ ... \circ \phi^{(3)}_{d_{n}(n q_n)^{2(m-1)}}, \phi^{(2)}_{d_{n}(n q_n)^{2(m-1)}}, \phi^{(1)}_{d_{n}(n q_n)^{2(m-1)}}, \phi^{(2)}_{d_{n}(n q_n)^{2(m-1)}}, \phi^{(3)}_{d_{n}(n q_n)^{2(m-1)}}
\]

on it. After an application of \( R_{\alpha_n+1}^{l \cdot m_n} \) with some \( l \in \{1, ..., k\} \) the image \( R_{\alpha_n+1}^{l \cdot m_n} \circ \phi_n^{-1} (I_n) \) lies in a domain where

\[
\phi_n = \phi^{(1)}_{d_{n}(n q_n)^{2(m-1)}}, \phi^{(2)}_{d_{n}(n q_n)^{2(m-1)}}, \phi^{(3)}_{d_{n}(n q_n)^{2(m-1)}}, \phi^{(2)}_{d_{n}(n q_n)^{2(m-1)}}, \phi^{(1)}_{d_{n}(n q_n)^{2(m-1)}}.
\]
1. If $U = T$, then $\phi_n \circ R_{\alpha_{n+1}}^{l_{m_n}} \circ \phi_n^{-1}(I_n)$ is contained in the cube

$$\left[ \frac{l}{nq_n}, \frac{l}{nq_n} + \frac{1}{(nq_n)^2} \right] \times \prod_{i=2}^{m} \left[ \frac{j_i}{n^2 \cdot q_n^2}, \frac{j_i + 1}{n^2 \cdot q_n^2} \right].$$

In particular, $\pi_{\mathcal{E}} \left( \phi_n \circ R_{\alpha_{n+1}}^{l_{m_n}} \circ \phi_n^{-1}(I_n) \right)$ is contained in the same $\frac{1}{(nq_n)^2}$-cube as $\pi_{\mathcal{E}}(I_n)$.

2. If $U > T$, then $\phi_n \circ R_{\alpha_{n+1}}^{l_{m_n}} \circ \phi_n^{-1}$ is contained in the same $\frac{1}{(nq_n)^2}$-cube as $\pi_{\mathcal{E}}(I_n)$.

**Proof.** When applying the map $\phi_n^{-1}$ we observe that the set is positioned in such a way that all the occurring maps $\varphi_{t_{i+1}}^{-1}$ act as the respective rotations. Then we compute $\phi_n^{-1}(I_n)$ with the aid of Proposition 3.2.

$$\bigcup \left[ \frac{j_2}{d_n \cdot (nq_n)^2(T+1)} + \frac{t_2(2)}{d_n \cdot (nq_n)^2(T+2)} + \cdots + \frac{t_2(n-k)}{d_n \cdot (nq_n)^2(n-k+T)} + \frac{1}{10n^4 \cdot d_n \cdot (nq_n)^2(n-k+T)} \right]$$

$$\times \prod_{i=2}^{m-1} \left[ 1 - \frac{j_1(i-1)T+1}{(nq_n)^2} - \cdots - \frac{j_1(iT)}{(nq_n)^2i} - \frac{j_1(iT+1)}{(nq_n)^2(i+1)} - \frac{j_1(iT+2)}{(nq_n)^2(i+2)} - \cdots - \frac{j_1(i-k)}{(nq_n)^2(i-k+1)} \right]$$

$$\times \left[ 1 - \frac{t_1((m-1)T+1)}{(nq_n)^2} - \cdots - \frac{t_1((m-k)T)}{(nq_n)^2(m-k+1)} + \frac{1}{10n^4 \cdot (nq_n)^2(m-k+1)} \right]$$

By our choice of the number $m_n$ the subsequent application of $R_{\alpha_{n+1}}^{l_{m_n}}$ yields a shift by $\frac{l_{m_n}}{nq_n} + l_{a_n}$ on the $\theta$-axis, at which $a_n$ is the “error term” introduced in Remark 4.4. With the aid of the bound on $l_{a_n}$ from Remark 4.4 we can compute the image of $I_n$ under $\Phi_n := \phi_n \circ R_{\alpha_{n+1}}^{l_{m_n}} \circ \phi_n^{-1}$. In the first case (i.e. $U = T$) we get...
In the second case $U = T + S > T$ we calculate $\phi_n \circ P_{\alpha_{n+1}}^{k_{n+1}} \circ \phi_n^{-1}(I_n)$ to

$$U \left[ \frac{l}{nq_n} + \frac{j_1}{(nq_n)^{2(T+1)}} + \frac{j_2}{(nq_n)^{2(T+2)}} + \frac{j_3}{(nq_n)^{2(T+3)}} + \cdots + \frac{t_1^{(S)}}{d_n \cdot (nq_n)^{2(T+U)}} + \frac{t_2^{(S)}}{d_n \cdot (nq_n)^{2(T+U+1)}} + \cdots + \frac{t_1^{((m-1)T+1))}}{d_n \cdot (nq_n)^{2(U+1)}} + \frac{t_1^{(m-n-k)+2(m-1):U-T)}}{d_n \cdot (nq_n)^{2(m-n-k)+2(m-1):U-T}} + \frac{1}{10n^4 \cdot d_n \cdot (nq_n)^{2m(n-1+k)+2(m-1):U-T}} \right]$$

$$\times \left[ \frac{l}{(nq_n)^2} + \frac{l_1^{(T+1)}}{d_n \cdot (nq_n)^{2(T+1)}} + \frac{l_2^{(T+1)}}{d_n \cdot (nq_n)^{2(T+2)}} + \frac{l_3^{(T+1)}}{d_n \cdot (nq_n)^{2(T+3)}} + \cdots + \frac{l_1^{(m-n-k)+2(m-1):U-T)}}{d_n \cdot (nq_n)^{2(m-n-k)+2(m-1):U-T}} + \frac{1}{10n^4 \cdot d_n \cdot (nq_n)^{2m(n-1+k)+2(m-1):U-T}} \right]$$

$$\times \prod_{i=3}^{m} \left[ \frac{l_1^{(S+1)}}{(nq_n)^2} + \frac{l_2^{(S+1)}}{(nq_n)^2} + \frac{l_3^{(S+1)}}{(nq_n)^2} + \cdots + \frac{t_1^{(S+1)}}{d_n \cdot (nq_n)^{2m(n-1+k)+2(m-1):U-T}} + \frac{1}{10n^4 \cdot d_n \cdot (nq_n)^{2m(n-1+k)+2(m-1):U-T}} \right]$$
Thus such a set $\Phi_n(I_n)$ has a $\theta$-width of at most $\frac{1}{d_n(nq_n)^{(r+\delta)}}$. Let $J = \prod_{n=2}^{\infty} \left[ \frac{1}{10n^2}, 1 - \frac{1}{10n^2} \right)$ and $\tilde{J} \subset J$ be any $(m-1)$-dimensional cuboid of $r_1$-length $l_1 \geq \frac{1}{nq_n}$ and of side length $q_n^{-1}$ in the $r_2, \ldots, r_{m-1}$-coordinates. In each of the coordinates $r_2, \ldots, r_{m-1}$, $\tilde{J}$ contains at least $\left( (nq_n)^2 \cdot (\frac{n}{q_n})^{n-k-S} \right)$ and at most $\left( (nq_n)^2 \cdot (\frac{n}{q_n})^{n-k-S} \right)$ intervals of the form

$$\left[ \frac{t_1^{(nq_n)^2}}{(nq_n)^2} + \ldots + \frac{t_i^{(nq_n)^2}}{(nq_n)^2} \cdot \frac{1}{10n^4 \cdot (nq_n)^{2(n-k-S)}}, \frac{t_i^{(nq_n)^2}}{(nq_n)^2} + \ldots + \frac{t_i^{(nq_n)^2}}{(nq_n)^2} \cdot \frac{1}{10n^4 \cdot (nq_n)^{2(n-k-S)}} \right].$$

while in the $r_1$-coordinate $\tilde{J}$ contains at least $\left( \left( \frac{l_1 (nq_n)^2}{10n^4} \right) - 2 \right) \cdot \left( (nq_n)^2 \cdot (1 - \frac{1}{10n^4}) \right)$ and at most $l_1 \cdot (q_n)^2 \cdot (n-k-S)$ such intervals. Hereby, we estimate

$$\mu(\Phi_n(I_n) \cap S^1 \times \tilde{J}) \geq \frac{l_1}{d_n \cdot (nq_n)^{2(T+m-1)+m-2}} \cdot \left( 1 - \frac{3}{l_1 (nq_n)^2} \right) \cdot \left( 1 - \frac{1}{10n^4} \right)^{(m-1)(n-k-S)-1} \cdot \left( 1 - \frac{1}{5n^4} \right)^{(m-1)(S-1)+m \cdot (n+k)-T} \cdot \mu(I_n) \cdot \mu^{(m-1)}(\tilde{J})$$

exploiting $l_n \geq \frac{1}{nq_n}$ and

$$\mu(I_n) = \frac{1}{d_n \cdot (nq_n)^{2(T+m-1)} \cdot \left( 1 - \frac{1}{5n^4} \right)^{(m+k)-(S-1)+m \cdot (n+k)-T}}.$$

On the other hand, we have

$$\mu(\Phi_n(I_n) \cap S^1 \times \tilde{J}) \leq \frac{1}{d_n \cdot (nq_n)^{2(T+m-1)+m-2}} \cdot l_1 \cdot \left( 1 - \frac{1}{5n^4} \right)^{(m+k)-(S-1)+m \cdot (n+k)-T} \cdot \mu(I_n) \cdot \mu^{(m-1)}(\tilde{J})$$

for $n$ sufficiently large. Hence, the properties of a $(\frac{1}{d_n(nq_n)^2}, \frac{1}{10n^4}, \frac{1}{nq_n})$-distribution are fulfilled.

The previous lemma shows the significance of an understanding of how the $(nq_n)$-powers in the definition of $\phi_n$ evolve while passing from $\left[ \frac{l}{nq_n}, \frac{l+1}{nq_n} \right] \times [0,1]^{m-1}$ to $\left[ \frac{l+i}{nq_n}, \frac{l+i+1}{nq_n} \right] \times [0,1]^{m-1}$:

**Lemma 4.6.** Let $l, v, i \in \mathbb{Z}$, $0 \leq l < n - k$, $0 \leq v < nq_n$ and $0 < i \leq k$. On every section $\left[ \frac{l+i}{nq_n} + \frac{v}{n^2q_n^2}, \frac{l+i+1}{nq_n} \right] \times [0,1]^{m-1}$ the ratio of domains, where the $(nq_n)$-power in the definition of $\phi_n$ is greater than the $(nq_n)$-power of $\phi_n$ in the corresponding domain in $\left[ \frac{l}{nq_n} + \frac{v}{n^2q_n^2}, \frac{l+1}{nq_n} \right] \times [0,1]^{m-1}$, is equal to $\sum_{d=1}^v \beta_{d,n} = \kappa_{i,n}$. 

16
Proof. First of all, we notice that there is no decline of \((nq_n)\)-powers when passing from \(\left[\frac{l}{nq_n}, \frac{l+1}{nq_n}\right] \times [0,1]^{m-1}\) to \(\left[\frac{l+i}{nq_n}, \frac{l+i+1}{nq_n}\right] \times [0,1]^{m-1}\). Obviously, on the domains of the form

\[
\left[\frac{l}{n \cdot q_n} + \frac{v}{n^2 \cdot q_n^2}, \frac{d_i}{n \cdot q_n} \right] \times [0,1]^{m-1},
\]

i.e. on a corresponding \(\theta\)-length of \(\sum_{d=1}^{k-1} \beta_{d,n} \cdot \tilde{\beta}_d \cdot \beta_{d,n} \cdot \tilde{\beta}_d\), we always have an increasing \((nq_n)\)-power while passing from \(l\) to \(l + i\) for any \(i \geq 1\).

A more careful analysis has to be executed on the domains of the form

\[
\left[\frac{l}{n \cdot q_n} + \frac{v}{n^2 \cdot q_n^2}, \frac{d_i}{n \cdot q_n} + \frac{v}{n^2 \cdot q_n^2} + \frac{k \cdot c_{2,n}}{d_i \cdot n^2 \cdot q_n^2} \right] \times [0,1]^{m-1}
\]

in the definition of \(\phi_n\): When passing from \(l\) to \(l + i\) the number \(\tilde{s}\) changes to \(\tilde{s} - i \mod k\). Accordingly for each \(s \in \{0, 1, \ldots, k - 1\}\) the corresponding number \(t_s\) is changed to \(t_s + i \mod k\). On the one hand, we observe that on the domains \(\Delta_{l+i,v,s,u}\) with \(u < u_{l+i-1,n}\) the \((nq_n)\)-power is larger than on \(\Delta_{l,v,s,u}\). On the other hand, the \((nq_n)\)-power remains the same on domains of the form \(\Delta_{l+i,v,s,u}\) for \(u \geq u_{l+i-1,n}\) due to \(l + i + k - (t_s) = l + k - t_s\). Hence, this yields an increased \((nq_n)\)-power on a corresponding \(\theta\)-length of \(\sum_{t_s=0}^{k-1} u_{l+i-1,n}\), where we use the convention \(u_{j,n} = c_{2,n}\) for \(j \geq k\). By definition of the numbers \(u_{j,n}\) in equation \(\phi_n\) we get

\[
\sum_{t_s=0}^{k-1} u_{l+i-1,n} = k \cdot \tilde{\beta}_{d,n} \cdot \sum_{d=1}^{k-1} \tilde{\beta}_{d,n} \]

in case of \(i < k\). In case of \(i = k\) the fraction is equal to \(\frac{k \cdot \tilde{\beta}_{d,n}}{n^2 \cdot q_n^2}\).

Altogether the \((nq_n)\)-power in the definition of \(\phi_n\) has increased on a corresponding \(\theta\)-length of \(\frac{1}{n^2 q_n^2} \sum_{d=1}^{k-1} \tilde{\beta}_{d,n} = \frac{1}{n^2 q_n^2} \kappa_{i,n}\) using equation \(\phi_n\) \(\square\)

Remark 4.7. For a partition element \(I_\eta = \bigcup_{j=0}^{N} I_j \times W\) we introduce subsets \(N_i, i = 1, \ldots, k\) of the set of indices \(\{0, 1, \ldots, N - 1\}\) in the following way: \(j \in N_i\) if the \((nq_n)\)-power of \(\phi_n\) on \(R \times (I_j \times W)\) is larger than the \((nq_n)\)-power of \(\phi_n\) on \(I_j \times W\).

By the previous Lemma and the shape of partition elements in \(\eta\) we have

\[
\mu \left( \bigcup_{j \in N_i} I_j \times W \right) = \kappa_{i,n} \cdot \mu \left( I_\eta \right).
\]

5 Criterion for \((\kappa_1, \ldots, \kappa_k)\)-weak mixing

In this section we will prove a criterion for \((\kappa_1, \ldots, \kappa_k)\)-weak mixing on \(M = S^1 \times [0,1]^{m-1}\) in the setting of the beforehand constructions. For the derivation we need a couple of lemmas. At first we examine a sequence of partial partitions that will be used in the criterion:
Lemma 5.1. Consider the sequence of partial partitions \((\eta_n)_{n \in \mathbb{N}}\) constructed in section 3.3 and the diffeomorphisms \(g_n\) from chapter 3.3. Furthermore let \((H_n)_{n \in \mathbb{N}}\) be a sequence of measure-preserving smooth diffeomorphisms satisfying \(\|DH_n\| \leq \frac{\ln(q_n)}{n}\) for every \(n \in \mathbb{N}\) and define the partial partitions \(\nu_n = \left\{ \Gamma_n = H_{n-1} \circ g_n \left( \hat{I}^i_n \right) : \hat{I}^i_n \in \eta_n \right\}\). Then we get \(\nu_n \to \varepsilon\).

Proof. By construction \(\eta_n = \left\{ \hat{I}^i_n : i \in \Lambda_n \right\}\), where \(\Lambda_n\) is a countable set of indices. Because of \(\eta_n \to \varepsilon\) it holds \(\lim_{n \to \infty} \mu \left( \bigcup_{i \in \Lambda_n} \hat{I}^i_n \right) = 1\). Since \(H_{n-1} \circ g_n\) is measure-preserving we conclude:

\[
\lim_{n \to \infty} \mu \left( \bigcup_{i \in \Lambda_n} \Gamma^i_n \right) = \lim_{n \to \infty} \mu \left( \bigcup_{i \in \Lambda_n} H_{n-1} \circ g_n \left( \hat{I}^i_n \right) \right) = \lim_{n \to \infty} \mu \left( H_{n-1} \circ g_n \left( \bigcup_{i \in \Lambda_n} \hat{I}^i_n \right) \right) = 1.
\]

For any \(m\)-dimensional cube with sidelength \(l_n\) it holds: \(\text{diam}(W_n) = \sqrt{m} \cdot l_n\). Because every element of the partition \(\eta_n\) is contained in a cube of side length \(\frac{1}{n^q_n}\) it follows for every \(i \in \Lambda_n\):

\[
\text{diam} \left( \hat{I}^i_n \right) \leq \sqrt{m} \cdot \frac{1}{n^q_n}.
\]

Hence, for every \(\Gamma^i_n = H_{n-1} \circ g_n \left( \hat{I}^i_n \right)\):

\[
\text{diam} \left( \Gamma^i_n \right) \leq \|DH_n\| \cdot \|Dg_n\| \cdot \frac{\sqrt{m}}{n^2 \cdot q_n^2} \leq \frac{\ln(q_n)}{n} \cdot n \cdot q_n \cdot \frac{\sqrt{m}}{n^2 \cdot q_n^2} \leq \frac{\ln(q_n)}{n^2 \cdot q_n^2}.
\]

We conclude \(\lim_{n \to \infty} \text{diam} \left( \Gamma^i_n \right) = 0\) and consequently \(\nu_n \to \varepsilon\). \(\square\)

In the following the Lebesgue measures on \(S^1\), \([0,1]^{m-2}\), \([0,1]^{m-1}\) are denoted by \(\hat{\lambda}\), \(\mu^{(m-2)}\) and \(\hat{\mu}\) respectively. The next technical result is needed in the proof of Lemma 5.3.

Lemma 5.2. Given an interval \(K\) on the \(r_1\)-axis and a \((m-2)\)-dimensional interval \(Z\) in \((r_2, ..., r_{m-1})\) \(K_{c, \gamma}\) denotes the cuboid \([c, c + \gamma] \times K \times Z\) for some \(\gamma > 0\). We consider the diffeomorphism \(\tilde{g}_b : M \to M\), \(\tilde{g}_b(\theta, r_1, ..., r_{m-1}) = (\theta + b \cdot r_1, r_1, ..., r_{m-1})\) with some \(b \in \mathbb{N}\) and an interval \(L = [l_1, l_2] \) of \(S^1\).

If \(b \cdot \lambda(K) > 2\), then for the set \(Q := \pi_F \left( K_{c, \gamma} \cap \tilde{g}_b^{-1} (L \times K \times Z) \right)\) we have:

\[
\left| \hat{\mu}(Q) - \lambda(K) \cdot \hat{\lambda}(L) \cdot \mu^{(m-2)}(Z) \right| \leq \left( \frac{2}{b} \cdot \hat{\lambda}(L) + \frac{2 \cdot \gamma}{b} + \gamma \cdot \lambda(K) \right) \cdot \mu^{(m-2)}(Z).
\]

Proof. We consider the set:

\[
Q_b := \pi_F \left( K_{c, \gamma} \cap \tilde{g}_b^{-1} (L \times K \times Z) \right)
\]

\[
= \left\{ (r_1, r_2, ..., r_{m-1}) \in K \times Z : (\theta + b \cdot r_1, \theta) \in L \times K \times Z, \theta \in [c, c + \gamma] \right\}
\]

\[
= \left\{ (r_1, r_2, ..., r_{m-1}) \in K \times Z : b \cdot r_1 \in [l_1 - c - \gamma, l_2 - c] \mod 1 \right\}
\]

The interval \(b \cdot K\) seen as an interval in \(\mathbb{R}\) does not intersect more than \(b \cdot \lambda(K) + 2\) and not less than \(b \cdot \lambda(K) - 2\) intervals of the form \([i, i + 1]\) with \(i \in \mathbb{Z}\). Therefore we compute on the one side:

\[
\hat{\mu}(Q) \leq \left( b \cdot \lambda(K) + 2 \right) \cdot \frac{l_2 - (l_1 - \gamma)}{b} \cdot \mu^{(m-2)}(Z)
\]

\[
= \left( \lambda(K) \cdot \hat{\lambda}(L) + 2 \cdot \frac{\lambda(L)}{b} + \lambda(K) \cdot \frac{2 \cdot \gamma}{b} \right) \cdot \mu^{(m-2)}(Z)
\]
and on the other side
\[
\hat{\mu} (Q) \geq (b \cdot \lambda (K) - 2) \cdot \frac{l_2 - (l_1 - \gamma)}{b} \cdot \mu^{(m-2)} (Z)
\]
\[
= \left( \lambda (K) \cdot \hat{\lambda} (L) - 2 \cdot \frac{\hat{\lambda} (L)}{b} + \lambda (K) \cdot \gamma - \frac{2 \cdot \gamma}{b} \right) \cdot \mu^{(m-2)} (Z).
\]

Both equations together yield:
\[
\left| \hat{\mu} (Q) - \lambda (K) \cdot \hat{\lambda} (L) \cdot \mu^{(m-2)} (Z) - \gamma \cdot \lambda (K) \cdot \mu^{(m-2)} (Z) \right| \leq \left( \frac{2 \cdot \hat{\lambda} (L)}{b} + \frac{2 \cdot \gamma}{b} \right) \cdot \mu^{(m-2)} (Z).
\]

The claim follows because
\[
\left| \hat{\mu} (Q) - \lambda (K) \cdot \hat{\lambda} (L) \cdot \mu^{(m-2)} (Z) - \gamma \cdot \lambda (K) \cdot \mu^{(m-2)} (Z) \right| \leq \left| \hat{\mu} (Q) - \lambda (K) \cdot \hat{\lambda} (L) \cdot \mu^{(m-2)} (Z) \right|.
\]

\[\square\]

**Lemma 5.3.** Let \( n \) be sufficiently large, \( g_n \) as in section 3.2 and \( \hat{I}_n = \bigcup_{j=0}^{N} I_j \times W \subset \eta_n \), where \( \eta_n \) is the partial partition constructed in section 3.3. For the diffeomorphism \( \Phi_n \) constructed in section 3.4 we consider \( \Phi_n = g_n \circ \hat{F}_{n+1} \circ \phi_n^{-1} \) for some \( i \in \{1, \ldots, k\} \). We assume that \( \Phi_n \left( \frac{1}{d_n(nq_n)^2}, \frac{1}{10n}, \frac{1}{10n}, \frac{1}{nq_n}, q_n^{-1}, \frac{3}{n} \right) \)-uniformly distributes \( I_j \times W \) and denote \([\frac{1}{10n}, 1 - \frac{1}{10n}] \) by \( J_n \). Then for every \( m \)-dimensional cube \( S \) of side length \( q_n^{-1} \) lying in \( S^1 \times J_n \) we get
\[
|\mu (I_j \times W \cap \Phi_n^{-1} \circ g_n^{-1} (S)) - \mu (I_j \times W) \cdot \mu (S)| \leq \frac{22}{n} \cdot \mu (I_j \times W) \cdot \mu (S) \quad (4)
\]

In other words this Lemma tells us that parts of a partition element contained in the “distribution part” of \( \Phi_n \) are “almost uniformly distributed” under \( g_n \circ \phi_n \) on the whole manifold \( M = S^1 \times [0, 1] \).

**Proof.** Let \( S \) be a \( m \)-dimensional cube with side length \( q_n^{-1} \) lying in \( S^1 \times J_n \). Furthermore we denote:
\[
S_0 = \pi_\theta (S) \quad S_{r_1} = \pi_{r_1} (S) \quad S_\bar{r} = \pi_{(r_2, \ldots, r_{m-1})} (S) \quad S_r = S_{r_1} \times S_\bar{r} = \pi_\tau (S).
\]

Obviously: \( \hat{\lambda} (S_0) = \lambda (S_{r_1}) = q_n^{-1} \) and \( \hat{\lambda} (S_\theta) \cdot \lambda (S_{r_1}) \cdot \mu^{(m-2)} (S_\bar{r}) = \mu (S) = q_n^{-m} \).

By assumption \( \Phi_n \left( \frac{1}{d_n(nq_n)^2}, \frac{1}{10n}, \frac{1}{10n}, \frac{1}{nq_n}, q_n^{-1}, \frac{3}{n} \right) \)-distributes \( I_j \times W \), in particular \( \Phi_n (I_j \times W) \subseteq [c, c + \gamma] \times J_n \) for some \( c \in S^1 \) and some \( \gamma \leq \frac{1}{d_n(nq_n)^2} \). By construction of the map \( g_n \) it holds:
\[
\Phi_n (I_j \times W) \cap g_n^{-1} (S) \subseteq [c, c + \gamma] \times S_r =: K_{c, \gamma}.
\]

Since \( 2 \gamma \leq \frac{1}{d_n(nq_n)^2} < q_n^{-1} \), we can define a cuboid \( S_1 \subseteq S \), where \( S_1 := [s_1 + \gamma, s_2 - \gamma] \times S_r \) using the notation \( S_\theta = [s_1, s_2] \). We examine the two sets
\[
Q := \pi_\tau (K_{c, \gamma} \cap g_n^{-1} (S_0 \times S_r)) \quad Q_1 := \pi_\tau (K_{c, \gamma} \cap g_n^{-1} ([s_1 + \gamma, s_2 - \gamma] \times S_r))
\]

As seen above \( \Phi_n (I_j \times W) \cap g_n^{-1} (S) \subseteq \Phi_n (I_j \times W) \cap g_n^{-1} (S) \cap K_{c, \gamma} \), which implies the inclusion \( \Phi_n (I_j \times W) \cap g_n^{-1} (S) \subseteq \Phi_n (I_j \times W) \cap (S^1 \times Q) \).
Claim: On the other hand: $\Phi_n (I_j \times W) \cap (S^1 \times Q_1) \subseteq \Phi_n (I_j \times W) \cap g_n^{-1} (S)$.

Proof of the claim: For $(\theta, \vec{r}) \in \Phi_n (I_j \times W) \cap (S^1 \times Q_1)$ arbitrary it holds $(\theta, \vec{r}) \in \Phi_n (I_j \times W)$, i.e. $\theta \in [c, c + \gamma]$, and $\vec{r} \in \pi_r (K_{c, \gamma} \cap g_n^{-1} ([s_1 + \gamma, s_2 - \gamma] \times S_r))$. This implies the existence of $\hat{\theta} \in [c, c + \gamma]$ satisfying $(\hat{\theta}, \vec{r}) \in K_{c, \gamma} \cap g_n^{-1} (S_1)$. Hence, there are $\beta \in [s_1 + \gamma, s_2 - \gamma]$ and $\tilde{r}_1 \in S_r$, such that $g_n (\hat{\theta}, \vec{r}) = (\beta, \tilde{r}_1)$. Since $g_n$ maps sets of the form $I \times \vec{r}$ to a set $I \times \vec{r}$, where $I, \vec{r} \subset S^1$ are intervals of the same length, and $|\theta - \hat{\theta}| \leq \gamma$, we have $g_n (\theta, \vec{r}) = (\tilde{\beta}, \tilde{r}_1')$ for some $\tilde{\beta} \in [s_1, s_2]$.

Altogether the following inclusions are true:

$$\Phi_n (I_j \times W) \cap (S^1 \times Q_1) \subseteq \Phi_n (I_j \times W) \cap g_n^{-1} (S) \subseteq \Phi_n (I_j \times W) \cap (S^1 \times Q)$$

Thus we obtain:

$$|\mu (I_j \times W \cap \Phi_n^{-1} (g_n^{-1} (S))) - \mu (I_j \times W) \cdot \mu (S)|$$

$$\leq \max \left( |\mu (I_j \times W \cap \Phi_n^{-1} (S^1 \times Q)) - \mu (I_j \times W) \cdot \mu (S)|, \right.$$

$$\left. |\mu (I_j \times W \cap \Phi_n^{-1} (S^1 \times Q_1)) - \mu (I_j \times W) \cdot \mu (S)| \right)$$

We want to apply Lemma 5.2 for $K = S_{r_1}$, $L = S_\hat{r}$, $Z = S_{\tilde{r}}$ and $b = n \cdot q_n$ (note that for $n > 2$: $b \cdot \lambda (K) = n \cdot q_n \cdot q_n^{-1} = n > 2$):
Now we can proceed
\[
|\mu (I_j \times W \cap \Phi_n^{-1} (S^1 \times Q)) - \mu (I_j \times W) \cdot \mu (S)| \\
\leq |\mu (I_j \times W \cap \Phi_n^{-1} (S^1 \times Q)) - \mu (I_j \times W) \cdot \tilde{\mu} (Q)| + \mu (I_j \times W) \cdot |\tilde{\mu} (Q) - \mu (S)| \\
\leq \frac{6}{n} \cdot \mu (I_j \times W) \cdot \mu (S) + \frac{14}{n} \cdot \mu (S) = \frac{20}{n} \cdot \mu (I_j \times W) \cdot \mu (S).
\]

Noting that \(\mu (S_1) = \mu (S) - 2\gamma \cdot \tilde{\mu} (S)\), and so \(\mu (S) - \mu (S_1) \leq 2 \cdot \frac{1}{nq_n} \cdot \tilde{\mu} (S) \leq \frac{2}{n} \cdot \mu (S)\) we obtain in the same way as above:
\[
|\mu (I_j \times W \cap \Phi_n^{-1} (S^1 \times Q_1)) - \mu (I_j \times W) \cdot \mu (S)| \leq \frac{22}{n} \cdot \mu (I_j \times W) \cdot \mu (S).
\]

Using equation \(3\) this yields:
\[
|\mu (I_j \times W \cap \Phi_n^{-1} (g_n^{-1} (S))) - \mu (I_j \times W) \cdot \mu (S)| \leq \frac{22}{n} \cdot \mu (I_j \times W) \cdot \mu (S).
\]

In the proof of the criterion we will consider specific cubes:

**Definition 5.4.** By \(S_{j_1, \ldots, j_m}\) we denote the cube \(\prod_{i=1}^{m} \left[ \frac{j_i}{q_n}, \frac{j_i+1}{q_n} \right]\). Let \(\tilde{\mathfrak{S}}_n\) be the family of cubes \(S_{j_1, \ldots, j_m}\) satisfying \(0 \leq j_1 \leq q_n - 1\) as well as \(\left\lfloor \frac{q_n}{10^m} \right\rfloor \leq j_i \leq q_n - \left\lfloor \frac{q_n}{10^m} \right\rfloor - 1\) for \(i = 2, \ldots, m\). Then \(\mathfrak{S}_n\) is defined to be the partial partition \(\mathfrak{S}_n := \{H_{n-1} (S_n) : S_n \in \tilde{\mathfrak{S}}_n\}\).

**Remark 5.5.** A partition element \(\tilde{I}_n = I_{l,v,j_1^{(1)},j_2^{(1)},j_3,\ldots,j_m}\) is contained in a cube
\[
\left[ \frac{s}{q_n} + \frac{l}{n q_n} + \frac{v}{q_n (n q_n)^2} \right], \ldots, \left[ \frac{s + v + 1}{n q_n} \right] \times \left[ \frac{j_1^{(1)}}{n q_n^2}, \frac{j_2^{(1)}}{n q_n^2} \right], \ldots, \left[ \frac{j_1^{(2)} + 1}{n q_n^2}, \frac{j_2^{(2)} + 1}{n q_n^2} \right] \times \prod_{i=3}^{m} \left[ \frac{j_i}{(n q_n)^2}, \frac{j_i + 1}{(n q_n)^2} \right].
\]

Thus \(g_n (\tilde{I}_n)\) is contained in
\[
\left[ \frac{s + j_2^{(1)}}{q_n} + \frac{l + j_2^{(2)}}{n q_n} + \frac{v}{n^2 q_n^2}, \frac{s + j_2^{(1)}}{q_n} + \frac{l + j_2^{(2)} + 1}{n q_n} + \frac{v + 1}{n^2 q_n^2} \right] \\
\times \left[ \frac{j_2^{(1)}}{n q_n^2}, \frac{j_2^{(2)}}{n q_n^2} \right] \times \prod_{i=3}^{m} \left[ \frac{j_i}{n^2 q_n^2}, \frac{j_i + 1}{n^2 q_n^2} \right].
\]

So we observe that \(g_n (\tilde{I}_n)\) is contained in a cube \(S_n \in \tilde{\mathfrak{S}}_n\) completely or both have an empty intersection due to the restrictions on \(j_2^{(2)}\).

By the same reasoning we have \(\mu (\tilde{R}_m \cap g_n^{-1} (S_n)) = \mu (\tilde{I}_n \cap g_n^{-1} (S_n))\) for every \(\tilde{I}_n \in \eta_n, i \in \{1, \ldots, k\}\) and \(S_n \in \tilde{\mathfrak{S}}_n\). With the aid of Lemma 4.3 and the bounds on \(a_n\) from Remark 4.4 this also yields
\[
\mu (\phi_n \circ R_m \cap g_n^{-1} (I_j \times W)) = \mu (I_j \times W \cap g_n^{-1} (S_n))
\]
for every \(j \notin N_i\).
Remark 5.6. Under the condition \( \|DH_{n-1}\|_0 \leq \frac{\ln(q_n)}{n} \) we have
\[
\text{diam} \left( H_{n-1}(S_n) \right) \leq \frac{\ln(q_n)}{n} \cdot \frac{\sqrt{m}}{q_n} \to 0
\]
as \( n \to \infty \). So we have \( \mathcal{G}_n \to \varepsilon \).

We investigate \((\kappa_{1,n}, \ldots, \kappa_{k,n})\)-weak mixing of \( f_n \) on such sets \( A_n \in \mathcal{G}_n \) and partition elements \( \Gamma_n \in \nu_n \).

Lemma 5.7. Let \( f_n = H_n \circ R_{n+1} \circ H_n^{-1} \) and the sequence \((m_n)_{n \in \mathbb{N}}\) be constructed as in the previous sections. For \( i = 1, \ldots, k \), every \( A_n \in \mathcal{G}_n \) and \( \Gamma_n \in \nu_n \) we have:
\[
|\mu \left( \Gamma_n \cap f_n^{-i}m_n (A_n) \right) - \kappa_{i,n} \cdot \mu (\Gamma_n) \cdot \mu (A_n) - (1 - \kappa_{i,n}) \cdot \mu (\Gamma_n \cap A_n) | \leq \frac{22}{m} \cdot \mu (\Gamma_n) \cdot \mu (A_n).
\]

Proof. We write \( A_n = H_{n-1}(S_n) \) and \( \Gamma_n = H_{n-1} \circ g_n \left( \hat{I}_n \right) \), at which \( \hat{I}_n = \bigcup_{j=0}^{N_j} I_j \times W \). Furthermore we note \( f_n^{-i}m_n = H_n \circ R_{n+1} \circ H_n^{-1} = H_{n-1} \circ g_n \circ \Phi_i \circ g_n^{-1} \circ H_n^{-1} \), where \( \Phi_i = \phi_n \circ R_{n+1} \circ \phi_n^{-1} \). Then we calculate
\[
|\mu \left( \Gamma_n \cap f_n^{-i}m_n (A_n) \right) - \kappa_{i,n} \cdot \mu (\Gamma_n) \cdot \mu (A_n) - (1 - \kappa_{i,n}) \cdot \mu (\Gamma_n \cap A_n) | \\
= |\mu \left( \hat{I}_n \cap \Phi_n^{-i} \circ g_n^{-1} (S_n) \right) - \kappa_{i,n} \cdot \mu (\hat{I}_n) \cdot \mu (S_n) - (1 - \kappa_{i,n}) \cdot \mu (\hat{I}_n \cap g_n^{-1} (S_n)) |
\]
We recall that for every \( i = 1, \ldots, k \):
\[
\mu \left( \bigcup_{j \in N_i} I_j \times W \right) = \kappa_{i,n} \cdot \mu (\hat{I}_n)
\]
(see Remark 4.7). Hereby, we conclude
\[
|\mu \left( \Gamma_n \cap f_n^{-i}m_n (A_n) \right) - \kappa_{i,n} \cdot \mu (\Gamma_n) \cdot \mu (A_n) - (1 - \kappa_{i,n}) \cdot \mu (\Gamma_n \cap A_n) | \\
\leq |\mu \left( \Phi_n \left( \bigcup_{j \notin N_i} I_j \times W \right) \cap g_n^{-1} (S_n) \right) - (1 - \kappa_{i,n}) \cdot \mu (\hat{I}_n \cap g_n^{-1} (S_n)) | \\
+ \sum_{j \in N_i} |\mu (I_j \times W \cap \Phi_n^{-i} \circ g_n^{-1} (S_n)) - \mu (I_j \times W) \cdot \mu (S_n) |.
\]
We start to examine the first term. By Remarks 4.7 and 5.5 we have
\[
(1 - \kappa_{i,n}) \cdot \mu (\hat{I}_n \cap g_n^{-1} (S_n)) = \mu \left( \left( \bigcup_{j \notin N_i} I_j \times W \right) \cap g_n^{-1} (S_n) \right).
\]
Additionally, Remark 5.5 tells us that \( \mu (I_j \times W \cap g_n^{-1} (S_n)) = \mu (\Phi_n^{-i} (I_j \times W) \cap g_n^{-1} (S_n)) \) for each \( j \notin N_i \). Hence, the first term is equal to 0.
In the next step, we examine the second term. We note that the cube $S_n$ is contained in $S^1 \times \left[ \frac{1}{10m}, 1 - \frac{1}{10m} \right]^{m-1}$. So we can apply Lemma 5.3 for $j \in N_i$:

$$\sum_{j \in N_i} |\mu(I_j \times W \cap \Phi_n^{-i} \circ g_n^{-1}(S_n)) - \mu(I_j \times W) \cdot \mu(S_n)| \leq \sum_{j \in N_i} \frac{22}{n} \cdot \mu(I_j \times W) \cdot \mu(S_n)$$

$$\leq \frac{22}{n} \cdot \mu(I_n) \cdot \mu(S_n).$$

Now we are able to prove the aimed criterion for $(\kappa_1, \ldots, \kappa_k)$-weak mixing.

**Proposition 5.8 (Criterion for $(\kappa_1, \ldots, \kappa_k)$-weak mixing).** Let $f_n = H_n \circ R_{\kappa_{n+1}} \circ H_n^{-1}$ and the sequence $(m_n)_{n \in \mathbb{N}}$ be constructed as in the previous sections. Suppose additionally that for every $n \in \mathbb{N}$ $d_0(f^{i-m_n}, f^{i+m_n}) < \frac{1}{2^n}$ for $i = 1, \ldots, k$, $\|DH_{n-1}\|_0 \leq \frac{\ln(q_n)}{n}$ and that the limit $f = \lim_{n \to \infty} f_n$ exists. Then $f$ is $(\kappa_1, \ldots, \kappa_k)$-weakly mixing.

**Proof.** Since every measurable set in $M = S^1 \times [0, 1]^{m-1}$ can be approximated by a countable disjoint union of cubes in $S^1 \times (0, 1)^{m-1}$ in arbitrary precision, we only have to prove the $(\kappa_1, \ldots, \kappa_k)$-weak mixing property in case that $A$ and $B$ are $m$-dimensional cubes in $S^1 \times (0, 1)^{m-1}$. So let $A, B \subseteq S^1 \times (0, 1)^{m-1}$ be $m$-dimensional cubes and $\varepsilon > 0$ be given.

According to Lemma 5.1 and Remark 5.2 respectively the partial partitions $\nu_n := H_{n-1} \circ g_n(\eta_n)$ and $\mathcal{S}_n$ converge to the decomposition into points. Thus we can approximate $B$ by a countable disjoint union of sets $\Gamma_n \in \nu_n$ and $A$ by a countable disjoint union of sets $C_n \in \mathcal{S}_n$ in given precision, when $n$ is chosen big enough. Consequently for $n$ sufficiently large there are sets $B_1 = \bigcup_{i \in \Sigma_1} \Gamma_i^n$, $B_2 = \bigcup_{i \in \Sigma_2} \Gamma_i^n$ with countable sets $\Sigma_1^n, \Sigma_2^n$ of indices satisfying $B_1 \subseteq B \subseteq B_2$ and $\mu(B \Delta B_j) \leq \varepsilon \cdot \mu(A) \cdot \mu(B)$ for $j = 1, 2$. Furthermore, there are sets $A_1 = \bigcup_{i \in \Sigma_1} C_i^n$, $A_2 = \bigcup_{i \in \Sigma_2} C_i^n$ with countable sets $\Sigma_1^n, \Sigma_2^n$ of indices satisfying $A_1 \subseteq A \subseteq A_2$, $|\mu(A) - \mu(A_j)| \leq \varepsilon \cdot \mu(A) \cdot \mu(B)$ as well as $\text{dist}(\partial A, \partial A_j) > \frac{1}{2^n}$ for $j = 1, 2$, if $n$ is chosen sufficiently large. Because of $d_0(f^{i-m_n}, f^{i+m_n}) < \frac{1}{2^n}$ for $i = 1, \ldots, k$ the following relations are true:

$$f^{i-m_n}(x) \in A_1 \implies f^{i-m_n}(x) \in A$$

$$f^{i-m_n}(x) \in A \implies f^{i-m_n}(x) \in A_2$$

Thus:

$$\mu(B_1 \cap f^{-i-m_n}(A_1)) \leq \mu(B \cap f^{-i-m_n}(A_1)) \leq \mu(B \cap f^{-i-m_n}(A)) \leq \mu(B \cap f^{-i-m_n}(A_2)) \leq \mu(B_2 \cap f^{-i-m_n}(A_2))$$

Additionally we choose $n$ such that $\frac{22}{n} < \varepsilon$ as well as $|\kappa - \kappa_{i,n}| < \varepsilon \cdot \mu(A) \cdot \mu(B)$ hold. We can apply Lemma 5.7 on the sets $A_2$ and $B_2$. Therewith we obtain the following estimate from above.
for every \( i \in \{1, \ldots, k\} \):
\[
\mu \left( B \cap f^{-i\cdot m} (A) \right) - \kappa_i \cdot \mu(A) \cdot \mu(B) - (1 - \kappa_i) \cdot \mu(A \cap B) \\
\leq \mu \left( B_2 \cap f^{-i\cdot m} (A_2) \right) - \kappa_i \cdot \mu(A) \cdot \mu(B) - (1 - \kappa_i) \cdot \mu(A \cap B) + 2 \cdot |\kappa_i - \kappa_i| \\
\leq \varepsilon \cdot \mu(A) \cdot \mu(B) + \kappa_i \cdot \mu(A_2) \cdot \mu(B_2) + (1 - \kappa_i) \cdot \mu(A \cap B_2) - \kappa_i \cdot \mu(A) \cdot \mu(B) \\
- (1 - \kappa_i) \cdot \mu(A \cap B) + 2 \cdot \varepsilon \cdot \mu(A) \cdot \mu(B) \\
\leq \varepsilon \cdot \mu(A) + \mu(A \cap B_2) + 3 \cdot \varepsilon \cdot \mu(A) \cdot \mu(B) \\
+ (1 - \kappa_i) \cdot \mu(A \cap B_2) + 2 \cdot \varepsilon \cdot \mu(A) \cdot \mu(B) \\
\leq 8 \cdot \varepsilon \cdot \mu(A) \cdot \mu(B).
\]

Analogously we estimate:
\[
\mu \left( B \cap f^{-i\cdot m} (A) \right) - \kappa_i \cdot \mu(A) \cdot \mu(B) - (1 - \kappa_i) \cdot \mu(A \cap B) \geq -8 \cdot \varepsilon \cdot \mu(A) \cdot \mu(B).
\]

Both estimates combined enable us to conclude:
\[
|\mu \left( B \cap f^{-i\cdot m} (A) \right) - \kappa_i \cdot \mu(A) \cdot \mu(B) - (1 - \kappa_i) \cdot \mu(A \cap B)| \leq 8 \cdot \varepsilon \cdot \mu(A) \cdot \mu(B).
\]

Since \( \varepsilon \) can be chosen arbitrarily small, the \((\kappa_1, \ldots, \kappa_k)\)-weak mixing property is proven. \( \square \)

6 Convergence of \((f_n)_{n\in\mathbb{N}}\) in \(\text{Diff}^\infty(M)\)

In the following we show that the sequence of constructed measure-preserving smooth diffeomorphisms \(f_n = H_n \circ R_{\alpha_n+1} \circ H_n^{-1}\) converges. For this purpose, we need a couple of results concerning the conjugation maps.

6.1 Properties of the conjugation maps \(\phi_n\) and \(H_n\)

In this subsection we want to find estimates on the norms \(|||H_n|||_k\). For this we will need the next technical result which is an application of the chain rule:

**Lemma 6.1.** Let \(\phi := \phi_{\lambda_m}^{(2)} \circ \ldots \circ \phi_{\lambda_2}^{(2)}, \ j \in \{1, \ldots, m\}\) and \(k \in \mathbb{N}\). For any multiindex \(\vec{a}\) with \(|\vec{a}| = k\) the partial derivative \(D_{\vec{a}} [\phi]_j\) consists of a sum of products of at most \((m - 1) \cdot k\) terms of the following form
\[
D_{\vec{b}} \left( \left[ \phi_{\lambda_1}^{(i)} \right]_{ij} \right) \circ \phi_{\lambda_{i-1}}^{(i-1)} \circ \ldots \circ \phi_{\lambda_2}^{(2)}
\]
where \(l \in \{1, \ldots, m\}\), \(i \in \{2, \ldots, m\}\) and \(\vec{b}\) is a multiindex with \(|\vec{b}| \leq k\).

In the same way we obtain a similar statement holding for the inverses:

**Lemma 6.2.** Let \(\psi := \left( \phi_{\lambda_2}^{(2)} \right)^{-1} \circ \ldots \circ \left( \phi_{\lambda_m}^{(m)} \right)^{-1}, \ j \in \{1, \ldots, m\}\) and \(k \in \mathbb{N}\). For any multiindex \(\vec{a}\) with \(|\vec{a}| = k\) the partial derivative \(D_{\vec{a}} [\psi]_j\) consists of a sum of products of at most \((m - 1) \cdot k\) terms of the following form
\[
D_{\vec{b}} \left( \left[ \left( \phi_{\lambda_i}^{(i)} \right)^{-1} \right]_{ij} \right) \circ \left( \phi_{\lambda_{i+1}}^{(i+1)} \right)^{-1} \circ \ldots \circ \left( \phi_{\lambda_m}^{(m)} \right)^{-1}
\]
where \(l \in \{1, \ldots, m\}\), \(i \in \{2, \ldots, m\}\) and \(\vec{b}\) is a multiindex with \(|\vec{b}| \leq k\).
With the aid of these technical results we can prove an estimate on the norms of the map \( \phi_n \):

**Lemma 6.3.** For every \( l \in \mathbb{N} \) it holds

\[
\|\|\phi_n\||\| \leq C \cdot q_n^{2(m-1)^2 \cdot (m-1)k}
\]

where \( C \) is a constant depending on \( m, l \) and \( n \), but is independent of \( q_n \).

**Proof.** First of all we consider the map \( \tilde{\phi}_\lambda := \phi_{\lambda, \epsilon, j} = C^{-1}_\lambda \circ \phi_{\epsilon, 1, j} \circ C_\lambda \) introduced in subsection 3.1:

\[
\tilde{\phi}_\lambda (x_1, ..., x_m) = \left( \frac{1}{\lambda} \left[ \phi_{\epsilon} \right]_1 (\lambda x_1, x_2, ..., x_m), \left[ \phi_{\epsilon} \right]_2 (\lambda x_1, x_2, ..., x_m), ..., \left[ \phi_{\epsilon} \right]_m (\lambda x_1, x_2, ..., x_m) \right)
\]

Let \( l \in \mathbb{N} \). We compute for a multiindex \( \bar{a} \) with \( 0 \leq |\bar{a}| \leq l \):

\[
\|D_{\bar{a}} [\tilde{\phi}_\lambda]_r\|_0 \leq \lambda^{l-1} \cdot \|\|\phi_{\epsilon}||\|_l.
\]

Hereby we estimate \( \|D_{\bar{a}} [\tilde{\phi}_\lambda]_r\|_0 \leq C \cdot \lambda^l \) and analogously \( \|D_{\bar{a}} [\tilde{\phi}_\lambda^{-1}]_r\|_0 \leq C \cdot \lambda^{-l} \) for a constant independent of \( \lambda \), in conclusion this yields \( \|\|\tilde{\phi}_\lambda\||\| \leq C \cdot \lambda^{l-1} \).

In the next step we consider \( \phi := \phi_{\lambda, \epsilon}^{(m)} \circ \phi_{\lambda}^{(2)} \). Let \( \lambda_{\text{max}} := \max \{ \lambda_2, ..., \lambda_m \} \). Inductively we will show \( \|\|\phi||\| \leq C \cdot \lambda_{\text{max}}^{m-1} \) for every \( l \in \mathbb{N} \), where \( C \) is a constant independent of \( \lambda_i \).

**Start:** \( l = 1 \). Let \( l \in \{1, ..., m\} \) be arbitrary. By Lemma 6.1 a partial derivative of \( |\phi| \) of first order consists of a sum of products of at most \( m - 1 \) first order partial derivatives of \( \phi_{\lambda, \epsilon}^{(j)} \).

We obtain using \( \|\|\phi_{\lambda, \epsilon}^{(j)}\||\| \leq C \cdot \lambda_{\text{max}} \) the estimate \( \|D_i [\phi]_l\|_0 \leq C_1 \cdot \lambda_{\text{max}}^{m-1} \) for every \( i \in \{1, ..., m\} \), where \( C_1 \) is a constant independent of \( \lambda \).

With the aid of Lemma 6.2 we obtain the same statement for \( \phi^{-1} = \left( \phi_{\lambda}^{(2)} \right)^{-1} \circ \phi_{\lambda}^{(m)} \).

Hence we conclude: \( \|\|\phi||\| \leq C_1 \cdot \lambda_{\text{max}}^{m-1} \).

**Assumption:** The claim is true for \( l \in \mathbb{N} \).

**Induction step \( l \to l + 1 \):** In the proof of Lemma 6.1 one observes that at the transition \( l \to l + 1 \) in the product of at most \( (m - 1) \cdot l \) terms of the form \( D_{\bar{a}} \left( \left[ \phi_{\lambda, \epsilon}^{(j)} \right]_l \right) \circ \phi_{\lambda, \epsilon}^{(l-1)} \circ ... \circ \phi_{\lambda, \epsilon}^{(2)} \) one is replaced by a product of a term \( D_{\bar{a}} D_{\bar{b}} \left( \left[ \phi_{\lambda, \epsilon}^{(j)} \right]_l \right) \circ \phi_{\lambda, \epsilon}^{(l-1)} \circ ... \circ \phi_{\lambda, \epsilon}^{(2)} \) with \( j \in \{1, ..., m\} \) and at most \( m - 2 \) partial derivatives of first order. Because of \( \|\|\phi_{\lambda, \epsilon}^{(j)}\||\| \leq C \cdot \lambda_{\text{max}}^{l+1} \) and \( \|\|\phi_{\lambda, \epsilon}^{(2)}\||\| \leq C \cdot \lambda_{\text{max}}^{l+1} \) the \( \lambda_{\text{max}} \)-exponent increases by at most \( m - 1 \) and at most \( (m - 2) \cdot l \cdot m - 1 \).

In the same spirit one uses the proof of Lemma 6.2 to show that also in case of \( \phi^{-1} \) the \( \lambda_{\text{max}} \)-exponent increases.

Using the assumption we conclude

\[
\|\|\phi||\| \leq C \cdot \lambda_{\text{max}}^{(m-1) \cdot l + (m-1)} = C \cdot \lambda_{\text{max}}^{l+1 \cdot (m-1)}.
\]

So the proof by induction is completed.

In the setting of our explicit construction of the map \( \phi_n \) in section 3.1 we have \( \epsilon = \frac{1}{20 \cdot n^2} \) and \( \lambda_{\text{max}} = d_n \cdot (n \cdot q_n)^{2(m-1)^2 \cdot (m-1)k} \). Thus:

\[
\|\|\phi_n\||\| \leq C (m, l, n) \cdot \left( d_n \cdot (n \cdot q_n)^{2(m-1)^2 \cdot (m-1)k} \right)^{(m-1)l}
\]

\[
\leq C (m, l, n) \cdot q_n^{2(m-1)^2 \cdot l \cdot (m-1)k}
\]

where \( C (m, l, n) \) is a constant independent of \( q_n \).
In the next step we consider the map \( h_n = g_n \circ \phi_n \) defined in section 3.2.

**Lemma 6.4.** For every \( l \in \mathbb{N} \) it holds:
\[
|||h_n|||_l \leq \bar{C} \cdot q_n^{2(m-1)^2 \cdot l \cdot (n+k)}
\]
where \( \bar{C} \) is a constant depending on \( m, l \) and \( n \), but is independent of \( q_n \).

**Proof.** By definition of the map \( h_n = g_n \circ \phi_n \) in section 3.2 we have:
\[
h_n (x_1, ..., x_m) = g_n \circ \phi_n (x_1, ..., x_m)
\]
\[
= \left( [\phi_n (x_1, ..., x_m)]_1 + n \cdot q_n \cdot [\phi_n (x_1, ..., x_m)]_2, [\phi_n (x_1, ..., x_m)]_2, ..., [\phi_n (x_1, ..., x_m)]_m \right)
\]
and
\[
h_n^{-1} (x_1, ..., x_m) = \phi_n^{-1} \circ g_n^{-1} (x_1, ..., x_m)
\]
\[
= \left( [\phi_n^{-1} (x_1 - n \cdot q_n \cdot x_2, x_2, ..., x_m)]_1, ..., [\phi_n^{-1} (x_1 - n \cdot q_n \cdot x_2, x_2, ..., x_m)]_m \right)
\]
We estimate:
\[
|||h_n|||_l \leq 2 \cdot (n \cdot q_n)^l \cdot |||\phi_n|||_l \leq \bar{C} (m, l, n) \cdot q_n^{2(m-1)^2 \cdot l \cdot (n-1+k)} \leq \bar{C} (m, l, n) \cdot q_n^{2(m-1)^2 \cdot l \cdot (n+k)}
\]
with a constant \( \bar{C} (m, l, n) \) independent of \( q_n \). \( \square \)

**Remark 6.5.** In the proof of the following Lemma we will use the formula of Faà di Bruno in several variables (e.g. [CS96]). For this we introduce an ordering on \( \mathbb{N}^d \): For multiindices \( \vec{\mu} = (\mu_1, ..., \mu_d) \) and \( \vec{\nu} = (\nu_1, ..., \nu_d) \) in \( \mathbb{N}^d \) we will write \( \vec{\mu} \prec \vec{\nu} \), if one of the following properties is satisfied:
1. \( |\vec{\mu}| < |\vec{\nu}| \), where \( |\vec{\mu}| = \sum_{i=1}^d \mu_i \).
2. \( |\vec{\mu}| = |\vec{\nu}| \) and \( \mu_1 < \nu_1 \)
3. \( |\vec{\mu}| = |\vec{\nu}| \), \( \mu_i = \nu_i \) for \( 1 \leq i \leq k \) and \( \mu_{k+1} < \nu_{k+1} \) for a \( 1 \leq k < d \)

Additionally we will use these notations:
- For \( \vec{\nu} = (\nu_1, ..., \nu_d) \in \mathbb{N}^d \):
  \[
  \vec{\nu}! = \prod_{i=1}^d \nu_i!
  \]
- For \( \vec{\nu} = (\nu_1, ..., \nu_d) \in \mathbb{N}^d \) and \( \vec{z} = (z_1, ..., z_d) \in \mathbb{R}^d \):
  \[
  \vec{z}^{\vec{\nu}} = \prod_{i=1}^d z_i^{\nu_i}
  \]
Then we get for the composition \( h (x_1, ..., x_d) := f \left( g^{(1)}(x_1, ..., x_d), ..., g^{(m)}(x_1, ..., x_d) \right) \) with sufficiently differentiable functions \( f : \mathbb{R}^m \to \mathbb{R}, g^{(i)} : \mathbb{R}^d \to \mathbb{R} \) and a multiindex \( \vec{\nu} \in \mathbb{N}^d \) with \( |\vec{\nu}| = n \):
\[
D_{\vec{\nu}} h = \sum_{\vec{x} \in \mathbb{N}^d \text{ with } 1 \leq |\vec{x}| \leq n} D_{\vec{x}} f \cdot \sum_{s=1}^n \sum_{p_\nu (\vec{x}, \vec{s})} \vec{\nu}! \cdot \prod_{j=1}^s \frac{[D_{\vec{s}} g]_{\vec{k}}}{k_j!} \cdot \left( \vec{\iota}_{j} ! \right)^{k_j}
\]
Hereby \( \left[D_{i_j}g \right] \) denotes \( \left(D_{i_j}g^{(1)}, ..., D_{i_j}g^{(m)} \right) \) and
\[
p_s \left( \nu, \lambda \right) := \left\{ \left( k_1, ..., k_s, i_1, ..., i_s \right) : k_i \in \mathbb{N}_0^m, |k_i| > 0, i_t \in \mathbb{N}_0^l, 0 < i_1 < ... < i_s, \sum_{i=1}^s k_i = \lambda \text{ and } \sum_{i=1}^s |k_i| \cdot i_t = \nu \right\}
\]

Finally we are able to prove an estimate on the norms of the map \( H_n \):

**Lemma 6.6.** For every \( l \in \mathbb{N} \) we get:
\[
|||H_n|||_l \leq \tilde{C} \cdot q_n^2(m-1)^2 \cdot l \cdot (n+k)
\]
where \( \tilde{C} \) is a constant depending solely on \( m, l, n \) and \( H_{n-1} \). Since \( H_{n-1} \) is independent of \( q_n \) in particular, the same is true for \( \tilde{C} \).

**Proof.** Let \( l \in \mathbb{N} \), \( r \in \{1, ..., m\} \) and \( \nu \in \mathbb{N}_0^m \) be a multiindex with \( |
u| = l \). By applying the before mentioned formula of Faà di Bruno we estimate:
\[
\|D^r[H_n]_r\|_0 = \|D^r[H_{n-1} \circ h_n]_r\|_0 \\
\leq \sum_{\lambda \in \mathbb{N}_0^m} \|D^\lambda[H_{n-1}]_r\|_0 \cdot \sum_{s=1}^l p_s(\nu, \lambda) \cdot \prod_{j=1}^s \frac{|||H_n|||_{\tilde{E}_j}}{|\tilde{E}_j|} .
\]
By definition of the set \( p_s \left( \nu, \lambda \right) \) we have \( \sum_{i=1}^s |k_i| \cdot i_t = \nu \). Hence:
\[
l = |
u| = \sum_{i=1}^s |k_i| \cdot i_t = \sum_{i=1}^s \sum_{t=1}^m |k_i| \cdot i_t = \sum_{i=1}^s |k_i| \cdot \sum_{t=1}^m i_t = \sum_{i=1}^s |k_i| \cdot |i|
\]
Hereby, we compute using Lemma 6.4 \( \prod_{j=1}^s \|h_n\|_{\tilde{E}_j} \leq \tilde{C} \cdot q_n^{2(m-1)^2 \cdot l \cdot (n+k)} \), where \( \tilde{C} \) is a constant independent of \( q_n \). Since \( H_{n-1} \) is independent of \( q_n \), we conclude:
\[
\|D^r[H_n]_r\|_0 \leq \tilde{C} \cdot q_n^{2(m-1)^2 \cdot l \cdot (n+k)},
\]
where \( \tilde{C} \) is a constant independent of \( q_n \).
In the same way we prove an analogous estimate on \( \|D^r[H_{n-1}^{-1}]_r\|_0 \) and verify the claim. \( \square \)

In particular we see that this norm can be estimated by a power of \( q_n \).

### 6.2 Proof of convergence
For the proof of the convergence of the sequence \( (f_n)_{n \in \mathbb{N}} \) in the \( \text{Diff}^\infty (M) \)-topology the next result, that can be found in [FSW07, Lemma 4] is very useful.
Lemma 6.7. Let \( k \in \mathbb{N}_0 \) and \( h \) be a \( C^\infty \)-diffeomorphism on \( M \). Then we get for every \( \alpha, \beta \in \mathbb{R} \):

\[
d_k \left( h \circ R_\alpha \circ h^{-1}, h \circ R_\beta \circ h^{-1} \right) \leq C_k \cdot \|h\|_{k+1} \cdot |\alpha - \beta|,
\]

where the constant \( C_k \) depends solely on \( k \) and \( m \). In particular \( C_0 = 1 \).

In the following Lemma we state that under some assumptions on the sequence \( (\alpha_n)_{n\in\mathbb{N}} \) the sequence \( (f_n)_{n\in\mathbb{N}} \) converges to \( f \in \mathcal{A}_\alpha(M) \) in the \( \text{Diff}^\infty(M) \)-topology. Afterwards we will show that we can fulfil these conditions (see Lemma 6.9).

Lemma 6.8. Let \( \varepsilon > 0 \) be arbitrary and \( (k_n)_{n\in\mathbb{N}} \) be a strictly increasing sequence of natural numbers satisfying \( \sum_{n=1}^{\infty} \frac{1}{k_n} < \varepsilon \). Furthermore we assume that in our constructions the following conditions are fulfilled:

\[
|\alpha - \alpha_1| < \varepsilon \quad \text{and} \quad |\alpha - \alpha_n| \leq \frac{1}{2 \cdot k_n \cdot C_{k_n} \cdot \|H_n\|_{k_n+1}} \text{ for every } n \in \mathbb{N}
\]

where \( C_{k_n} \) are the constants from Lemma 6.7.

1. Then the sequence of diffeomorphisms \( f_n = H_n \circ R_{\alpha_{n+1}} \circ H_n^{-1} \) converges in the \( \text{Diff}^\infty(M) \)-topology to a measure-preserving smooth diffeomorphism \( f \), for which \( d_\infty(f, R_\alpha) < 3 \cdot \varepsilon \) holds.

2. Also the sequence of diffeomorphisms \( \hat{f}_n = H_n \circ R_{\alpha} \circ H_n^{-1} \in \mathcal{A}_\alpha(M) \) converges to \( f \) in the \( \text{Diff}^\infty(M) \)-topology. Hence \( f \in \mathcal{A}_\alpha(M) \).

Proof. See [Ku16, Lemma 5.8.].

As announced we show that we can satisfy the conditions from Lemma 6.8 in our constructions:

Lemma 6.9. Let \( (k_n)_{n\in\mathbb{N}} \) be a strictly increasing sequence of natural numbers with \( \sum_{n=1}^{\infty} \frac{1}{k_n} < \infty \) and \( C_{k_n} \) be the constants from Lemma 6.7. For any Liouvillean number \( \alpha \) there exists a sequence \( \alpha_n = \frac{p_n}{q_n} \) of rational numbers with \( 10n^2 \) divides \( q_n \), such that our conjugation maps \( H_n \) constructed in section 3.1 and 3.2 fulfil the following conditions:

1. For every \( n \in \mathbb{N} \):

\[
|\alpha - \alpha_n| < \frac{1}{2 \cdot k_n \cdot C_{k_n} \cdot \|H_n\|_{k_n+1}}
\]

2. For every \( n \in \mathbb{N} \):

\[
|\alpha - \alpha_n| < \frac{1}{2^{n+1} \cdot k \cdot q_n \cdot \|H_n\|_1}
\]

3. For every \( n \in \mathbb{N} \)

\[
\|DH_{n-1}\|_0 < \frac{\ln(q_n)}{n}
\]

Proof. In Lemma 6.6 we saw \( \|H_n\|_{k_n+1} \leq C_n \cdot q_n^{2(m-1)^2(n+1)(k+1)} \), where the constant \( C_n \) was independent of \( q_n \). Thus we can choose \( q_n \geq \hat{C}_n \) for every \( n \in \mathbb{N} \). Hence we obtain: \( \|H_n\|_{k_n+1} \leq q_n^{2m^2(n+k)(k+1)} \).

Besides \( q_n \geq \hat{C}_n \) we keep the condition \( q_n \geq 200 \cdot (n-1)^2 \cdot k \cdot d_n^{-1} \cdot (n-1)^4(n-1+k) \cdot q_n^{-4(n-2+k)} \) from Remark 4.4 in mind. Furthermore we can demand \( \|DH_{n-1}\|_0 < \frac{\ln(q_n)}{n} \) from \( q_n \) because \( H_{n-1} \)
is independent of \( q_n \). Since \( \alpha \) is a Liouville number, we find a sequence of rational numbers \( \tilde{\alpha}_n = \frac{p_n}{q_n}, \tilde{\rho}_n, q_n \) relatively prime, under the above restrictions (formulated for \( \tilde{q}_n \)) satisfying:

\[
|\alpha - \tilde{\alpha}_n| = \left| \frac{\tilde{\rho}_n}{q_n} \right| < \frac{|\alpha - \alpha_{n-1}|}{2^{n+1} \cdot k \cdot k_n \cdot C_{k_n} \cdot (10n^2)^{1+2\cdot m^2 \cdot (n+k) \cdot (k+1)^2} \cdot \tilde{q}_n^{1+2\cdot m^2 \cdot (n+k) \cdot (k+1)^2}}.
\]

Put \( q_n := 10n^2 \cdot \tilde{q}_n \) and \( p_n := 10n^2 \cdot \tilde{p}_n \). Then we obtain:

\[
|\alpha - \alpha_n| < \frac{|\alpha - \alpha_{n-1}|}{2^{n+1} \cdot k \cdot k_n \cdot C_{k_n} \cdot q_n^{1+2\cdot m^2 \cdot (n+k) \cdot (k+1)^2}}.
\]

So we have \( |\alpha - \alpha_n| \xrightarrow{n \to \infty} 0 \) monotonically. Because of \( |||H_n|||_{k_n+1}^{k_n+1} \leq q_n^{2\cdot m^2 \cdot (n+k) \cdot (k+1)^2} \) this yields:

\[
|\alpha - \alpha_n| < \frac{1}{2^{n+1} \cdot k \cdot q_n \cdot k_n \cdot C_{k_n} \cdot |||H_n|||_{k_n+1}^{k_n+1}}. \quad \text{Thus the first property of this Lemma is fulfilled.}
\]

Furthermore, we note \( k_n \geq 1 \) and \( C_{k_n} \geq 1 \) by Lemma 6.7. Thus \( q_n \cdot k_n \cdot C_{k_n} \geq q_n \). Moreover, \( |||H_n|||_{k_n+1} \geq |||H_n|||_0 = 1 \), because \( H_n : S^1 \times [0,1]^{m-1} \to S^1 \times [0,1]^{m-1} \) is a diffeomorphism. Hence \( |||H_n|||_{k_n+1} \geq |||H_n|||_1 \). Altogether we conclude \( 2^{n+1} \cdot q_n \cdot k_n \cdot C_{k_n} \cdot |||H_n|||_{k_n+1}^{k_n+1} \geq 2^{n+1} \cdot q_n \cdot |||H_n|||_1 \) and so:

\[
|\alpha - \alpha_n| < \frac{1}{2^{n+1} \cdot k \cdot q_n \cdot k_n \cdot C_{k_n} \cdot |||H_n|||_{k_n+1}^{k_n+1}} \leq \frac{1}{2^{n+1} \cdot k \cdot q_n \cdot \|H_n\|_1}, \quad (6)
\]

i.e. we verified the second property.

\[\square\]

Remark 6.10. Lemma 6.9 shows that the conditions of Lemma 6.8 are satisfied. Therefore our sequence of constructed diffeomorphisms \( f_n \) converges in the \( \text{Diff}^\infty (M) \)-topology to a diffeomorphism \( f \in A_n(M) \).

To apply Proposition 5.8 we need another result:

Lemma 6.11. Let \( (\alpha_n)_{n \in \mathbb{N}} \) be constructed as in Lemma 6.9. Then it holds for every \( n \in \mathbb{N} \), for every \( i \in \mathbb{N}, i \leq k \), and for every \( \tilde{m} \leq q_{n+1} \):

\[
d_0 \left( f_i^{\tilde{m}}, f_n^{\tilde{m}} \right) \leq \frac{1}{2^n}.
\]

Proof. According to our construction it holds \( h_n \circ R_{\alpha_n} = R_{\alpha_n} \circ h_n \) and hence

\[
f_{n-1} = H_n^{-1} \circ R_{\alpha_n} \circ H_n^{-1} = H_n^{-1} \circ R_{\alpha_n} \circ h_n^{-1} \circ H_n^{-1} = H_n^{-1} \circ h_n \circ R_{\alpha_n} \circ h_n^{-1} \circ H_n^{-1} = H_n \circ R_{\alpha_n} \circ h_n^{-1} \circ H_n^{-1}.
\]

Hereby and with the aid of Lemma 6.7 we compute:

\[
d_0 \left( f_j^{\tilde{m}}, f_{j-1}^{\tilde{m}} \right) = d_0 \left( H_j \circ R_{i \cdot \tilde{m} \cdot \alpha_n} \circ H_{j-1}^{-1}, H_j \circ R_{i \cdot \tilde{m} \cdot \alpha_n} \circ H_{j-1}^{-1} \right) \leq |||H_j|||_{1 \cdot i \cdot \tilde{m} \cdot 2 \cdot |\alpha - \alpha_j|}.
\]

Since \( \tilde{m} \leq q_{n+1} \leq q_j \) we conclude for every \( j > n \) using equation 3:

\[
d_0 \left( f_j^{\tilde{m}}, f_{j-1}^{\tilde{m}} \right) \leq |||H_j|||_{1 \cdot i \cdot \tilde{m} \cdot 2 \cdot |\alpha - \alpha_j|} \leq |||H_j|||_{1 \cdot i \cdot \tilde{m} \cdot 2 \cdot \frac{1}{k \cdot q_j \cdot |||H_j|||_1}} \leq \frac{i \cdot \tilde{m}}{k \cdot q_j} \cdot \frac{1}{2^j} \leq \frac{1}{2^j}.
\]

Thus for every \( \tilde{m} \leq q_{n+1} \) we get the claimed result:

\[
d_0 \left( f_i^{\tilde{m}}, f_n^{\tilde{m}} \right) = \lim_{k \to \infty} d_0 \left( f_k^{\tilde{m}}, f_n^{\tilde{m}} \right) \leq \lim_{k \to \infty} \sum_{j=n+1}^{k} d_0 \left( f_j^{\tilde{m}}, f_{j-1}^{\tilde{m}} \right) \leq \sum_{j=n+1}^{k} \frac{1}{2^j} = \left( \frac{1}{2} \right)^n.
\]

\[\square\]
Remark 6.12. Note that the sequence \((m_n)_{n\in\mathbb{N}}\) defined in section 4 meets the mentioned condition \(m_n \leq q_{n+1}\) and hence 6.11 can be applied on it.

Concluding we have checked that all the assumptions of Proposition 5.8 are satisfied. Thus this criterion guarantees that the constructed diffeomorphism \(f \in A_\alpha(M)\) is \((\kappa_1, \ldots, \kappa_k)\)-weakly mixing. In addition, for every \(\varepsilon > 0\) we can choose the parameters by Lemma 6.11 in such a way, that \(d_\infty (f, R_\alpha) < \varepsilon\) holds.

In order to prove the genericity results in section 7 we have to compute the weak distance between \(f\) and \(f_n\):

**Lemma 6.13.** Let \(\nu_n := H_{n-1} \circ g_n (\eta_n)\) and \((m_n)_{n\in\mathbb{N}}\) be the sequence of natural numbers defined in section 4. Then we have for every \(i \in \{1, \ldots, k\}\)

\[
\sum_{c \in \mathbb{C}_n} \mu \left( f_{n}^{i-m_n} (c) \triangle f_{n}^{i-m_n} (c) \right) < \frac{1}{n} \cdot \frac{1}{n^{2m} \cdot q_n^{10m}}
\]

**Proof.** At first we observe for \(\Gamma_n = H_{n-1} \circ g_n \left( \hat{I}_n \right) \in \nu_n\)

\[
\mu \left( f_{n}^{i-m_n} (\Gamma_n) \triangle f_{n}^{i-m_n} (\Gamma_n) \right) = \mu \left( R_{\alpha_{n+1}}^{i-m_n} \left( \phi_n^{-1} \left( \hat{I}_n \right) \right) \triangle h_{n+1} \circ R_{\alpha_{n+2}}^{i-m_n} \circ h_{n+1}^{-1} \left( \phi_n^{-1} \left( \hat{I}_n \right) \right) \right)
\]

and introduce the notation \(b_{n,i} := d_0 \left( R_{\alpha_{n+1}, h_{n+1} \circ R_{\alpha_{n+2}} \circ h_{n+1}^{-1} \circ \phi_n^{-1} \left( \hat{I}_n \right) \right)\).

In case of \(0 \leq l < n - k\) there are

\[
n \cdot q_n \cdot \left( n q_n^2 - 2 \cdot \left[ \frac{q_n^2}{10n^2} \right] \right) \cdot (n - k - 1) \cdot \left( n^2 q_n^2 - 2 \cdot \left[ \frac{q_n^2}{10n^2} \right] \right)^{m-2} \leq (n \cdot q_n)^{3(m-1)+1}
\]

elements of the partition \(\eta_n\) on \(\left[ \frac{l}{n \cdot q_n}, \frac{l+1}{n \cdot q_n} \right] \times [0, 1]^{m-1}\). By the shape of elements in \(\eta_n\) and the calculations in the proof of Lemma 6.11 the image of such an element under \(R_{\alpha_{n+1}}^{i-m_n} \circ \phi_n^{-1}\) consists of

\[
1 + \sum_{d=1}^{k} c_{d,n} \cdot \left( n^2 q_n^2 - 2 \cdot \left[ \frac{q_n^2}{10n^2} \right] \right)^{n(n-1+k)-1} \cdot \left( n^2 q_n^2 - 2 \cdot \left[ \frac{q_n^2}{10n^2} \right] \right)^{(m-1)(n-2+k)}
\]

blocks.

On the “distribution part” such a block has sidelengths \(\frac{1-\frac{1}{n \cdot q_n}}{(n \cdot q_n)^{2(n-1+k)+1}}\) in the \(\theta\)-coordinate, \(\frac{1-\frac{1}{n \cdot q_n}}{(n \cdot q_n)^{2(n-1+k)+1}}\) in the coordinate \(r_1, \ldots, r_{m-2}\) as well as \(\frac{1-\frac{1}{n \cdot q_n}}{(n \cdot q_n)^{2(n-1+k)-2(n-1)+T}}\) in the \(r_{m-1}\)-coordinate for some \(T \in \{1, \ldots, n-1\}\). The part of \(h_{n+1} \circ R_{\alpha_{n+2}} \circ h_{n+1}^{-1} \left( \phi_n^{-1} \left( \hat{I}_n \right) \right)\)

corresponding to any block of \(R_{\alpha_{n+1}}^{i-m_n} \left( \phi_n^{-1} \left( \hat{I}_n \right) \right)\)

surrounds a block of sidelengths \(\frac{1-\frac{1}{n \cdot q_n}}{(n \cdot q_n)^{2(n-1+k)+1}} - 2b_{n,i}\) in the \(\theta\)-coordinate, \(\frac{1-\frac{1}{n \cdot q_n}}{(n \cdot q_n)^{2(n-1+k)+1}} - 2b_{n,i}\) in the \(r_1, \ldots, r_{m-2}\)-coordinates and \(\frac{1-\frac{1}{n \cdot q_n}}{(n \cdot q_n)^{2(n-1+k)-2(n-1)+T}} - 2b_{n,i}\) in the
\[2b_{n,i} \text{ in the } r_{m-1}\text{-coordinate as well as it is contained in a block of sidelengths } \frac{1-\frac{1}{m_t}}{2(n-q_n)^t} + \]
\[2b_{n,i} \text{ in the } \theta\text{-coordinate, } \frac{1}{2(n-q_n)^{t+1}} + 2b_{n,i} \text{ in the } r_1, \ldots, r_{m-2}\text{-coordinates and } \frac{1}{2(n-q_n)^{t+1}}.\]

Similar considerations apply on the block \(R^i_{n+1} \circ \phi_n^{-1} (I_N \times W).\)

Since
\[b_{n,i} = d_0 \left( R^i_{n+1}, h_{n+1} \circ R^i_{\alpha n} \circ h_{n+1}^{-1} \right) \leq |||h_{n+1}|||_1 \cdot k \cdot m_n \cdot |\alpha_{n+1} - \alpha_{n+2}| \]
\[< |||H_{n+1}|||_1 \cdot q_{n+1} \cdot 2 \cdot |\alpha_{n+1} - \alpha| < \frac{1}{2m^2(n+1)k^2_{n+1}}\]
by Lemma 6.9 we conclude
\[
\sum_{c \in \nu_n} \mu \left( f^{mn}_n (c) \triangle f^{i,m_n}_n (c) \right) \leq (n-k) \cdot q_n \cdot (n \cdot q_n)^{2(m-1)+1} \sum_{d=1}^k c_{d,n} \cdot (nq_n)^{4 - m(n-1+k)} \cdot 4 \cdot m \cdot b_{n,i}
\]
\[< \frac{1}{2n} \cdot \frac{1}{n^{2m} \cdot q_n^{3m}}\]
This implies the claim.

\[\square\]

7 Proof of genericity

First of all, Proposition 2.2 yields the denseness of \((\kappa_1, \ldots, \kappa_k)\)-weakly mixing diffeomorphisms in \(A_\alpha (M):\)
Because of \(A_\alpha (M) = \{ h \circ R_\alpha \circ h^{-1} : h \in \text{Diff}^\infty (M, \mu) \} \) it is enough to show that for every diffeomorphism \(h \in \text{Diff}^\infty (M, \mu)\) and every \(\epsilon > 0\) there is a \((\kappa_1, \ldots, \kappa_k)\)-weakly mixing diffeomorphism \(\tilde{f}\) such that \(d_\infty (\tilde{f}, h \circ R_\alpha \circ h^{-1}) < \epsilon\). For this purpose, let \(h \in \text{Diff}^\infty (M, \mu)\) and \(\epsilon > 0\) be arbitrary. Since \(\text{Diff}^\infty (M)\) is a Lie group, the conjugating map \(g \mapsto h \circ g \circ h^{-1}\) is continuous with respect to the metric \(d_\infty\). Continuity in the point \(R_\alpha\) yields the existence of \(\delta > 0\), such that \(d_\infty (g, R_\alpha) < \delta\) implies \(d_\infty (h \circ g \circ h^{-1}, h \circ R_\alpha \circ h^{-1}) < \epsilon\). By Proposition 2.2 we can find a \((\kappa_1, \ldots, \kappa_k)\)-weakly mixing diffeomorphism \(f\) with \(d_\infty (f, R_\alpha) < \delta\). Hence \(\tilde{f} := h \circ f \circ h^{-1}\) satisfies \(d_\infty (\tilde{f}, h \circ R_\alpha \circ h^{-1}) < \epsilon\). Note that \(\tilde{f}\) is \((\kappa_1, \ldots, \kappa_k)\)-weakly mixing.

In order to prove the genericity statement in Theorem 1 we consider all sequences of constructed diffeomorphisms \((f_n)_{n \in \mathbb{N}}\) satisfying the requirements from the previous sections. Let \(U_n (f_n)\) be the subsequent neighbourhood of the diffeomorphism \(f_n:\)
\[U_n (f_n) := \]
\[\left\{ g \in \text{Diff}^\infty (M, \mu) : d_{\kappa_{n+1}} (f_n, g) < \frac{2}{k_{n+1}}, \sum_{\Gamma_n \in \nu_n} \mu \left( g^{i,m_n} (\Gamma_n) \triangle f^{i,m_n} (\Gamma_n) \right) < \frac{1}{n} \cdot \frac{1}{n^{2m} \cdot q_n^{3m}} \text{ for } i = 1, \ldots, k \right\}\]

By \(\Theta_n\) we denote the union of all neighbourhoods \(U_n (f_n)\) over all the \(n\)-th diffeomorphisms in the above mentioned sequences. Since the neighbourhoods \(U_n (f_n)\) are open the sets \(\Theta_n\) are open as
well. Then
\[ \Theta := \bigcap_{n \in \mathbb{N}} \bigcup_{s \geq n} \Theta_s \]
is a $G_\delta$-set as the countable intersection of open sets.

- For all the sequences $(f_n)_{n \in \mathbb{N}}$ the respective limit diffeomorphism $f \in \mathcal{A}_\alpha(M)$ belongs to $\Theta$, because it belongs to $U_n(f_n)$ for every $n \in \mathbb{N}$ by construction (cf. Lemma 6.13). So $\Theta$ contains all the constructed diffeomorphisms with the aimed properties. Hence, it is dense in $\mathcal{A}_\alpha(M)$ due to the above considerations.

- In the next step we want to show that $f \in \Theta$ is a $(\kappa_1, \ldots, \kappa_k)$-weakly mixing diffeomorphism: For any $f \in \bigcap_{n \in \mathbb{N}} \bigcup_{s \geq n} \Theta_s$ there is a sequence $(n_l)_{l \in \mathbb{N}}$ with $n_l \to \infty$ as $l \to \infty$, such that $f \in \Theta_{n_l}$. So there is a sequence $(f_{n_l})_{l \in \mathbb{N}}$ of diffeomorphisms, at which $f_{n_l}$ is the $n_l$-th element of one of the above mentioned sequences of constructed diffeomorphisms, such that $f \in U_{n_l}(f_{n_l})$. We observe that $\nu_{n_l} \to \varepsilon$ as $l \to \infty$, where $\nu_{n_l}$ is the partition belonging to the diffeomorphism $f_{n_l}$. Moreover, we have
\[
\frac{23}{n_l} \cdot \mu(\Gamma_{n_l}) \cdot \mu(A_{n_l})
\]
for every $\Gamma_{n_l} \in \nu_{n_l}$ and $A_{n_l} \in \mathcal{G}_{n_l}$ by the definition of the neighbourhoods $U_{n_l}(f_{n_l})$. Then we can conclude that $f$ is $(\kappa_1, \ldots, \kappa_k)$-weakly mixing.

Thus the set of $(\kappa_1, \ldots, \kappa_k)$-weakly mixing diffeomorphisms in $\mathcal{A}_\alpha(M)$ contains a dense $G_\delta$-set. Hence, Theorem \[1\] is deduced from Proposition \[2.2\].

8 Applications

As a first application of the $(\kappa_1, \ldots, \kappa_k)$-weak mixing property we state [JL92] Lemma 1.3:

**Lemma 8.1.** Suppose that $T$ is $(1 - \kappa_1, \ldots, 1 - \kappa_K)$-weakly mixing with $\kappa_1, \ldots, \kappa_K \in (0, 1)$ and $(\log(\kappa_1), \ldots, \log(\kappa_K))$ linearly independent over $\mathbb{Q}$. Then
\[
\sigma_{T^{k(1)}} \cdots \sigma_{T^{k(l)}} \perp \sigma_{T^{k'(1)}} \cdots \sigma_{T^{k'(l)}}
\]
for all numbers $0 < k(1), \ldots, k(l), k'(1), \ldots, k'(l') \leq K$ unless $(k(1), \ldots, k(l))$ is a permutation of $(k'(1), \ldots, k'(l'))$.

Hereby, Corollary \[1\] follows from Theorem \[1\].

Moreover, we can follow the lines of [JL92] and [Ru79] Example 2] to get a smooth weakly mixing diffeomorphism with no measurable square root: Let $T \in \mathcal{A}_\alpha(M)$ be a diffeomorphism as constructed in Corollary \[1\] and $S = T \times T \times T$. By [JL92] Corollary 3| any measurable square root must have the form $(T^{i(1)} \times T^{i(2)} \times T^{i(3)}) U_\pi l(i) \in \mathbb{Z}$ and $\pi^2 = \text{id}$, where $U_\pi : M^3 \to M^3$ is defined by $U_\pi(x)(j) = x(\pi(j))$. Thus, for some $i$ we would have $\pi(i) = i$ and then $2l(i) = 1$ which is impossible for $l(i) \in \mathbb{Z}$.
