Q

Can we have $\aleph_1 < 2^{\aleph_0} < 2^{\aleph_1}$?

CLOSURE LEMMA

Theorem

If $\mathbb{P}$ is λ -closed and $\kappa < \lambda$,
then $\dot{p}(\kappa) \cap M = \dot{p}(\kappa) \cap M[G]$.

Corollary

Forcing with $\text{Fn}(\aleph_1 \times \aleph_3, 2, \aleph_1)$

(a) does not change $\dot{p}(\omega)$

(b) therefore preserves $\aleph_1$

[see ES#1 and notation between codes for club wellorders and preserving $\aleph_1$]

To be proved in
Lecture XVI.

λ -closed

: every descending seq. of length $< \lambda$ has a lower bound

Proof.

Let $f \in M[G]$, $f: \kappa \rightarrow 2$ and assume towards contradiction that $f \notin M$. $\rightarrow f \notin \mathcal{B}$.

$\mathcal{B} := \{f \in M; f: \kappa \rightarrow 2\}$ Let τ be a name for f .

By Forcing Theorem, there is $p \in G$ s.t. $p \Vdash \tau: \check{\kappa} \rightarrow \check{2}^1$
 $\tau \notin \mathcal{B}$.

Construct a κ -sequence of conditions p_α , $\alpha \leq \kappa$.

$p_0 := p$.

[DESCENDING]

If α is limit $\{p_\beta; \beta < \alpha\}$ is a descending seq.

[includes $\alpha = \kappa$.] so by λ -closure, let p_α be a lower bound.

If p_α is defined, $p_\alpha \leq p$, so $p_\alpha \Vdash \tau: \check{\kappa} \rightarrow \check{2}^1$.

In particular $p_\alpha \Vdash \tau(\check{\alpha}) = \check{0} \vee \tau(\check{\alpha}) = \check{1}$.

By def of $\Vdash \tau$, we find $q \leq p_\alpha$ s.t.

either $q \Vdash \tau(\check{\alpha}) = \check{0}$ or $q \Vdash \tau(\check{\alpha}) = \check{1}$.

Let $p_{\alpha+1} := q$.

The sequence $\{p_\alpha; \alpha \leq \kappa\}$ is defined in M [by Defining Theorem], so we can define

$$g(\alpha) = 1 : \iff p_{\alpha+1} \Vdash \tau(\check{\alpha}) = \check{1}.$$

Then $g \in M$.

$$\text{But now } p_\kappa \Vdash \tau(\check{\alpha}) = \check{1} \text{ for all } \alpha.$$

$$p_\kappa \Vdash \tau(\check{\alpha}) = \check{0}$$

$$\text{So } p_\kappa \Vdash \tau = \check{0}.$$

$$\implies p_\kappa \Vdash \tau \in \check{\mathbb{B}}.$$

$$\text{But } p_\kappa \leq p \Vdash \tau \notin \check{\mathbb{B}}. \quad \text{Contradiction!}$$

q.e.d.

IMPORTANT REMARK

Check notes of L. XV very carefully!

Lecture XV,
page 7:

With example (38), we need to figure out the c.c. of $\text{Fu}(N_1 \times N_3, 2, N_1)$. We need a more general DSL for this.

If A is a family of sets of size $< \kappa$ such that $|A| = \kappa^+$ & $\kappa^{\kappa} = \kappa$, then there is a DSL $D \subseteq A$ s.t. $|D| = \kappa^+$.

Kouze's tool.

1.6. Theorem. Let κ be any infinite cardinal. Let $\mathbb{P} = \langle \mathbb{P}, \leq \rangle$ be a regular and satisfy $\text{tp}(\mathbb{P}) \leq \kappa$. Assume $|\mathbb{P}| \geq \kappa$ and $\forall \alpha < \kappa$ $\mathbb{P} \restriction \alpha$ is a κ -c.c. such that $\mathbb{P} \restriction \alpha$ is a κ -c.c. and $\mathbb{P} \restriction \alpha$ is a κ -c.c.

Proof. By thinking of $\mathbb{P}$ as necessary, we may assume $|\mathbb{P}| = \kappa$. Then $\mathbb{P} \restriction \alpha$ is a κ -c.c. for all $\alpha < \kappa$. Since $\mathbb{P}$ is regular and $\mathbb{P} \restriction \alpha$ is a κ -c.c. for all $\alpha < \kappa$, there is some $\rho < \kappa$ such that $\mathbb{P} \restriction \rho$ is a κ -c.c. and $\mathbb{P} \restriction \rho$ is a κ -c.c. We now fix such a ρ and deal only with $\mathbb{P} \restriction \rho$.

For each $\alpha < \rho$, $\mathbb{P} \restriction \alpha$ is a κ -c.c. and $\mathbb{P} \restriction \alpha$ is a κ -c.c. Thus, $\mathbb{P} \restriction \alpha$ is a κ -c.c. and $\mathbb{P} \restriction \alpha$ is a κ -c.c. for all $\alpha < \rho$. Since $\mathbb{P}$ is regular, there is some λ such that $\mathbb{P} \restriction \lambda$ is a κ -c.c. and $\mathbb{P} \restriction \lambda$ is a κ -c.c. for all $\alpha < \lambda$. Let

$$\kappa_0 = \sup\{\alpha < \rho : \mathbb{P} \restriction \alpha \text{ is a } \kappa\text{-c.c. and } \mathbb{P} \restriction \alpha \text{ is a } \kappa\text{-c.c.}\}$$

then $\kappa_0 < \rho$ and $\mathbb{P} \restriction \kappa_0$ is a κ -c.c. and $\mathbb{P} \restriction \kappa_0$ is a κ -c.c. for all $\alpha < \kappa_0$.

Figure 11. A κ -c.c.

EXAMPLE SHEET #3.

(38) If κ is a cardinal, we say that $\mathbb{P}$ has the κ -c.c. if every antichain in $\mathbb{P}$ has cardinality smaller than κ . (Thus, the c.c. is the $\aleph_1$ -c.c.) If κ is a cardinal in M , we say that $\mathbb{P}$ preserves cardinals $\geq \kappa$ if for every $\mathbb{P}$ -generic filter G over M and every $\lambda \geq \kappa$, we have that $M[G] \models \lambda$ is a cardinal if and only if $M[G] \models \lambda$ is a cardinal. Show that if $M \models \kappa$ is a regular cardinal and $M \models \mathbb{P}$ has the κ -c.c., then $\mathbb{P}$ preserves cardinals $\geq \kappa$.

This DSL gives with some proof as before:

If $M \models 2^{\aleph_1} = \aleph_2$, then

$\text{Fu}(N_1 \times N_3, 2, N_1)$ has the N_2^M -c.c.

1.10. Lemma. Let $\mathbb{P} = \langle \mathbb{P}, \leq \rangle$ be a regular κ -c.c.

Proof. Let $\mathbb{P} = \langle \mathbb{P}, \leq \rangle$ be a regular κ -c.c. and suppose that $\{p_i : i < \kappa\}$ form an antichain. First, assume κ is regular. Then $\mathbb{P} \restriction \alpha$ is a κ -c.c. for all $\alpha < \kappa$, so by the κ -c.c. lemma (see 1.6) there is an $\alpha < \kappa$ such that $\mathbb{P} \restriction \alpha$ is a κ -c.c. and $\mathbb{P} \restriction \alpha$ is a κ -c.c. for all $\beta < \alpha$. Since there are less than κ possibilities for $p_i \restriction \alpha$, we have a contradiction as in the proof for $\kappa = \aleph_1$ (see Lemma 1.4).

If κ is singular, then since $\mathbb{P}$ is regular and κ -c.c., we could find a regular $\lambda < \kappa$ such that $\mathbb{P} \restriction \lambda$ is a κ -c.c. and $\mathbb{P} \restriction \lambda$ is a κ -c.c. for all $\alpha < \lambda$. This contradicts the κ -c.c. which we have just proved for regular κ . $\square$

So: Forcing over a model of GCH [or at least $2^{\aleph_1} = \aleph_2$]
 $\text{Fu}(N_1 \times N_3, 2, N_1)$ preserves cardinals $\geq N_2$.

Note that while $\text{Fu}(X, Y, N_1)$ is always N_1 -closed, the chain condition depended on the value of $N_1^{N_0}$. The partial order

$\text{Fu}(N_1 \times N_3, 2, N_1)$ has in general

the $(2^{N_0})^+$ -chain condition.

CH $\Rightarrow (2^{N_0})^+ = N_2$, so all cardinals are preserved.

However, if $2^{\aleph_0} > N_1$, then there is a gap and we do not know what cardinals are preserved.

If $M \models 2^{\aleph_0} = \aleph_2$, does
 $\text{Fu}(\aleph_1^M \times \aleph_3^M, 2, \aleph_1^M)$ preserve $\aleph_2^M$?

Answer

$\text{P} := \text{Fu}(\lambda^+ \times \kappa, 2, \lambda^+)$ ALWAYS ADDS
 a surjection from λ^+ to $2^{\lambda} \cap M$

Application If $\lambda = \aleph_0$ and $M = 2^{\aleph_0} = \aleph_2$, then
 $\text{Fu}(\aleph_1^M \times \kappa, 2, \aleph_1^M)$ adds a surjection
 from $\aleph_1^M$ onto $\mathcal{P}(\aleph_0) \cap M$, i.e.,
 $\aleph_2^M$. So $|\aleph_2^M| = \aleph_1^{M[G]}$!!!

Proof of P A generic for P is a map
 $f: \lambda^+ \times \kappa \rightarrow 2$

Define $h: \lambda^+ \rightarrow 2^{\lambda}$ by
 $h(\alpha)(\beta) = 1 \iff f(\alpha, \beta) = 1$.

Claim: h is a surjection onto $2^{\lambda} \cap M$.

If $g \in M$, $g: \lambda \rightarrow 2$, consider

$\mathcal{D}_g := \{ p \mid \exists \alpha < \lambda^+ \forall \beta < \lambda \ p(\alpha, \beta) = 1 \iff g(\beta) = 1 \}$

This is dense, and thus $g \in \text{ran}(h)$. q.e.d.

Back to our question

Can we get $\aleph_1 < 2^{\aleph_0} < 2^{\aleph_1}$?

Start with $M \models \text{GCH}$.

Consider $\mathbb{P} := \text{Fn}(\aleph_1 \times \aleph_3, 2, \aleph_1) \cap M$

and let G be $\mathbb{P}$ -generic / M .

Consider $\mathbb{Q} := \text{Fn}(\omega \times \aleph_2, 2) \cap M[G]$.

and let H be $\mathbb{Q}$ -generic / $M[G]$.

Claim: $M[G][H] \models \aleph_1 < 2^{\aleph_0} < 2^{\aleph_1}$.

FORCING ITERATION

"two-step iteration"

1. $\mathbb{P}$ is c.c.c. preserving over M since $M \models \text{GCH}$:
 $\Rightarrow \aleph_n^M = \aleph_n^{M[G]}$.

2. $\mathbb{Q}$ has c.c.c., so is c.c.c. preserving:
 $\Rightarrow \aleph_n^{M[G][H]} = \aleph_n^{M[G]} = \aleph_n^M$.

3. $M[G] \models 2^{\aleph_0} = \aleph_1 \wedge 2^{\aleph_1} = \aleph_3$.

[Lecture XV; since $M \models \text{CH}$]

4. Then $M[G][H] \models 2^{\aleph_0} = \aleph_2 \wedge 2^{\aleph_1} \geq \aleph_3$

[using a nice name analysis, we could calculate $2^{\aleph_1} = \aleph_3$].

This proves the claim.

IMPORTANT : The order of forcings matters!

Suppose $M \models \text{GCH}$

$$\mathbb{Q}' := \text{Fn}(\omega \times \aleph_2, 2) \cap M$$

$$\Vdash \mathbb{Q}'\text{-gen.} / M$$

$$\mathbb{P}' := \text{Fn}(\aleph_1 \times \aleph_3, 2, \aleph_1) \cap M[H]$$

$$\Vdash \mathbb{P}'\text{-gen.} / M[H]$$

Consider $M[H][G]$, then

$$M[H] \models 2^{\aleph_0} = \aleph_2 = 2^{\aleph_1}$$

But that means that forcing with $\mathbb{P}'$ WILL
collapse $\aleph_2^M = \aleph_2^{M[H]}$. $\triangleleft$

Since $\mathbb{P}'$ is $\aleph_1$ -closed,

$$\beta(\omega) \cap M[H] = \beta(\omega) \cap M[H][G]$$

In particular, $M[H][G] \models \text{CH}$.

So, this order does not
achieve what we want.

Final Remarks on forcing CH:

Assume $M \models 2^{\aleph_0} = \aleph_2$.

We have already seen (p. 7) that we can ACCIDENTALLY force CH: can we also do it on purpose?

Q: Can you obtain $M[G] \models CH$?

The natural forcing would be

$$\mathbb{P} := \text{Fn}(\omega, \aleph_1^M)$$

This collapses $\aleph_1^M$; it does not have c.c.c., but since it has size $\aleph_1^M$, it has the $\aleph_2^M$ -c.c., so all cardinals $\geq \aleph_2^M$ are preserved

Clearly therefore:

$$M[G] \models |\mathcal{P}(\omega) \cap M| = \aleph_2^M = \aleph_1^{M[G]}$$

But: is $|\mathcal{P}(\omega) \cap M| = |\mathcal{P}(\omega) \cap M|$?

Analysers of nice names:

- size $\aleph_1^M$
- size of antichains $\leq \aleph_1^M$

So: upper bound
 $(\aleph_1^M)^{\aleph_1^M \cdot \aleph_0} = (2^{\aleph_1^M})^M$

Note that if $f: \aleph_1^M \rightarrow 2$, $f \in M$ and $h: \omega \rightarrow \aleph_1^M$ is a bijection with $h \in M[G]$. Then $f \circ h: \omega \rightarrow 2$ is in $M[G]$ and for $f \neq g$, $f \circ h \neq g \circ h$, so every such f in M becomes a new subset of ω in $M[G]$.
 Thus: only if $M \models 2^{\aleph_1} = \aleph_2$ can we conclude that $M[G] \models CH$.
